1 序言

序言

约 10000 行代码，经历几十天编写，一部数学分析讲义习题解答呈现眼前，对于科大学生而言，这不仅是一本习题解答，还有更多的数学思维，全书表现出以下特点：

- 一、排版美观，详略得当， $\text{\LaTeX}$ 编辑非常适合阅读以及归纳
- 二、题目全解，附加模型，学习题目同时领略数学分析之乐趣
- 三、资料丰富，方法多样，前半部分配有方便查阅的知识总结

值此 63 周年校庆编出此书，祝福母校，祝福科大人！

程嘉杰

3 特别声明

本书电子版暂不公开
本书的部分解答可能有误
本书会不断更新换代, 欢迎意见

4 多元函数及曲面 总结

基本概念

- 共线共面的判定

 $\lambda \mathbf{a} + \mu \mathbf{b} = 0$ (λ, μ 不全为 0, 两向量共线);

 $\lambda \mathbf{a} + \mu \mathbf{b} + \nu \mathbf{c} = 0$ (λ, μ, ν 不全为 0, 三向量共面)

$$\overrightarrow{OM} = k_1 \overrightarrow{OA} + k_2 \overrightarrow{OB}, \quad k_1 + k_2 = 1 (A, B, M \text{ 三点共线})$$

- 向量的线性相关: 可以用共面, 或者 $\det(\mathbf{a}, \mathbf{b}, \mathbf{c}) = 0$ 判断
- 向量运算法则: 加减, 叉乘点乘混合积

$$\text{• 平行六面体体积: } V = S \cdot h = |\mathbf{a} \times \mathbf{b} \cdot \mathbf{c}|, \quad h = \frac{|\mathbf{c} \cdot (\mathbf{a} \times \mathbf{b})|}{|\mathbf{a} \times \mathbf{b}|}, \text{ 坐标表示下 } \mathbf{a} \times \mathbf{b} \cdot \mathbf{c} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

- 方向余弦、单位向量
- 平面方程

$$a(x - x_0) + b(y - y_0) + c(z - z_0) = 0, \quad \overrightarrow{P_1 P} \cdot (\overrightarrow{P_1 P_2} \times \overrightarrow{P_1 P_3}) = 0, P \text{ 是一点 (三点决定式)}$$

$$ax + by + cz + d = 0 \quad (\text{一般式})$$

$$\text{则有 } \begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0 \quad \frac{x}{\alpha} + \frac{y}{\beta} + \frac{z}{\gamma} = 1 \quad (\text{截距式})$$

- 两平面平行的表述: 存在非零常数 λ 使 $(a_1, b_1, c_1) = \lambda(a_2, b_2, c_2)$;
若还满足 $d_1 \neq \lambda d_2$, 则两平面平行且不重合

- 两平面垂直的表述: $\mathbf{n}_1 \cdot \mathbf{n}_2 = a_1 a_2 + b_1 b_2 + c_1 c_2 = 0$

- 相交平面的锐二面角: $\theta = \arccos \frac{|a_1 a_2 + b_1 b_2 + c_1 c_2|}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$

- 点面距离

$$|P_0 P_1| = |PP_0| |\cos \theta| = \left| \frac{\mathbf{n}}{|\mathbf{n}|} \cdot \overrightarrow{PP_0} \right|$$

$$= \frac{|a(x_0 - x) + b(y_0 - y) + c(z_0 - z)|}{\sqrt{a^2 + b^2 + c^2}} = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$$

- 直线方程

由 $\mathbf{r} - \mathbf{r}_0 = t\mathbf{v}$, 或 $\mathbf{r} = \mathbf{r}_0 + t\mathbf{v}$, t 是参数. 分量式为

$$x = x_0 + lt, y = y_0 + mt, z = z_0 + nt \quad (\text{参数式})$$

$$\frac{x - x_0}{l} = \frac{y - y_0}{m} = \frac{z - z_0}{n} \quad (\text{点向式})$$

$$\begin{cases} a_1 x + b_1 y + c_1 z + d_1 = 0 \\ a_2 x + b_2 y + c_2 z + d_2 = 0 \end{cases} \quad (\text{一般式})$$

可以取方向向量 $\mathbf{v} = \mathbf{n}_1 \times \mathbf{n}_2$, 再求上述方程组的一个特解作为直线上一点, 从而转为点向式

• 直线共面

有 $(\mathbf{r}_1 - \mathbf{r}_2) \cdot \mathbf{v}_1 \times \mathbf{v}_2 = 0$, 则有

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

• 点-线距离

$$d = \left| \overrightarrow{P_0 P_1} \right| \sin \theta = \frac{\left| \mathbf{v} \times \overrightarrow{P_0 P_1} \right|}{|\mathbf{v}|}$$

$$= \frac{\left(\left| \begin{vmatrix} m & n \\ y_1 - y_0 & z_1 - z_0 \end{vmatrix} \right|^2 + \left| \begin{vmatrix} n & l \\ z_1 - z_0 & x_1 - x_0 \end{vmatrix} \right|^2 + \left| \begin{vmatrix} l & m \\ x_1 - x_0 & y_1 - y_0 \end{vmatrix} \right|^2 \right)^{\frac{1}{2}}}{\sqrt{l^2 + m^2 + n^2}}$$

• 线-面关系：用方向向量和面法向量进行说明

• 旋转曲面的求法：

如果绕坐标轴 z 轴旋转，将 $x \rightarrow \sqrt{x^2 + y^2}$;

如果绕某一直线旋转，设旋转轴方向向量为 $\vec{\tau} = (a, b, c)$ ，轴上一点为 A ，母线上一点为 Q ，旋转后曲面上的对应点为 P ，则轴向投影和到轴的距离保持不变： $\vec{\tau} \cdot \overrightarrow{PQ} = 0$ ，且 $\frac{|\overrightarrow{AP} \times \vec{\tau}|}{|\vec{\tau}|} = \frac{|\overrightarrow{AQ} \times \vec{\tau}|}{|\vec{\tau}|}$ 。消去母线参数即可得到曲面方程，可参考下图。

二次曲面分类

椭圆柱面: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

双曲柱面: $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

抛物柱面: $y^2 = 2px$

椭球面: $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

单叶双曲面: $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

双叶双曲面: $\frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

圆锥面: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = z^2$

椭圆抛物面: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = z$

双曲抛物面: $\frac{x^2}{a^2} - \frac{y^2}{b^2} = z$

4 多元函数及曲面 总结

- 平面点集相关概念
- 多变量函数的极限

$$\forall \varepsilon > 0, \exists \delta > 0, 0 < \rho(M, M_0) < \delta, |f(M) - a| < \varepsilon$$

$$\text{记作 } \lim_{M \rightarrow M_0} f(M) = a$$

- ※ 极限和路径无关，即沿任意路径都有相同极限；
- ※ 两个累次极限存在且相等，并不能推出二重极限存在；若二重极限存在且相应累次极限存在，则它们必相等

二元函数的一致连续对于一个 δ 面积域成立

$$\bullet \text{ 偏导数的计算法则: } \frac{\partial(fg)}{\partial x} = g \frac{\partial f}{\partial x} + f \frac{\partial g}{\partial x}$$

★重要结论：一阶微分形式不变性；函数二阶连续偏导则 $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x}$ 二阶导和顺序无关

- n 元函数偏导数定义：

$$\frac{\partial f(x_1, \dots, x_n)}{\partial x_i} = \lim_{\Delta x_i \rightarrow 0} \frac{f(x_1, \dots, x_i + \Delta x_i, \dots, x_n) - f(x_1, \dots, x_i, \dots, x_n)}{\Delta x_i}$$

- 可微的充要条件：

$$\lim_{\rho \rightarrow 0} \frac{\Delta z - dz}{\rho} = 0 \Leftrightarrow \lim_{(\Delta x, \Delta y) \rightarrow (0,0)} \frac{f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0) - f'_x \Delta x - f'_y \Delta y}{\sqrt{(\Delta x)^2 + (\Delta y)^2}} = 0$$

可微，可（偏）导，连续充要关系图

★ 若各偏导数在该点的某邻域内存在并在该点连续，则函数在该点可微，从而连续；仅有偏导数存在一般不能推出连续

- 复合函数求导链式法则：

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial \xi} \frac{\partial \xi}{\partial x} + \frac{\partial u}{\partial \zeta} \frac{\partial \zeta}{\partial x}$$

（明辨每一次是对函数变量还是对参量求导）

- 隐函数存在定理及隐函数偏导求法：

$$\frac{dy}{dx} = -\frac{F'_x(x, y)}{F'_y(x, y)}, (F(x, y) = 0, F'_y(x, y) \neq 0)$$

- 三维方程组:

$$\begin{cases} F(x, y, z) = 0 \\ G(x, y, z) = 0 \end{cases} \text{ 以及隐函数 } y = y(x), z = z(x),$$

$$F(x, y(x), z(x)) = 0, \quad G(x, y(x), z(x)) = 0$$

$$y'(x) = -\frac{F'_x G'_z - F'_z G'_x}{F'_y G'_z - F'_z G'_y}, \quad z'(x) = \frac{F'_x G'_y - F'_y G'_x}{F'_y G'_z - F'_z G'_y}$$

$$\text{条件: Jacobi 行列式不为 } 0: \frac{\partial(F, G)}{\partial(y, z)} = \begin{vmatrix} \frac{\partial F}{\partial y} & \frac{\partial F}{\partial z} \\ \frac{\partial G}{\partial y} & \frac{\partial G}{\partial z} \end{vmatrix} \neq 0$$

- 四维方程组:

$$\begin{cases} F(x, y, u, v) = 0, \\ G(x, y, u, v) = 0. \end{cases} \text{ 以及隐函数组 } u = u(x, y), v = v(x, y)$$

对 x, y 求偏导分别得到四个方程

$$\begin{aligned} \frac{\partial F}{\partial x} + \frac{\partial F}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial F}{\partial v} \frac{\partial v}{\partial x} &= 0, & \frac{\partial F}{\partial y} + \frac{\partial F}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial F}{\partial v} \frac{\partial v}{\partial y} &= 0 \\ \frac{\partial G}{\partial x} + \frac{\partial G}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial G}{\partial v} \frac{\partial v}{\partial x} &= 0, & \frac{\partial G}{\partial y} + \frac{\partial G}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial G}{\partial v} \frac{\partial v}{\partial y} &= 0 \end{aligned}$$

可以继续使用 Cramer 法则解出 u, v 分别对 x, y 导数, 也可以用 Jacobi 行列式

$$\frac{\partial u}{\partial x} = -\frac{\partial(F, G)}{\partial(x, v)} / \frac{\partial(F, G)}{\partial(u, v)}, \quad \frac{\partial v}{\partial x} = -\frac{\partial(F, G)}{\partial(u, x)} / \frac{\partial(F, G)}{\partial(u, v)}$$

- 逆映射的微商: 如方程 $F(x, y, u, v) = u - u(x, y) = 0$ 对 u 求导可以得到

$$\frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u} = 1$$

$$\frac{\partial v}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial u} = 0$$

$$\therefore \frac{\partial x}{\partial u} = \frac{\frac{\partial v}{\partial y}}{\frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial v}{\partial x} \frac{\partial u}{\partial y}}, \quad \frac{\partial y}{\partial u} = -\frac{\frac{\partial v}{\partial x}}{\frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial v}{\partial x} \frac{\partial u}{\partial y}}$$

- 弧长参数、曲率

$$\text{方向导数: } \frac{\partial F}{\partial \mathbf{e}} = \mathbf{grad} F \cdot \mathbf{e}, \text{ 计算方法?}$$

- 隐式曲面 (线) 的参数特征, 如 F, G 表示的隐式曲线

$$\text{切向量 } \boldsymbol{\tau} = \mathbf{grad} F \times \mathbf{grad} G = \frac{\partial(F, G)}{\partial(y, z)} \mathbf{i} + \frac{\partial(F, G)}{\partial(z, x)} \mathbf{j} + \frac{\partial(F, G)}{\partial(x, y)} \mathbf{k}$$

- 二元微分中值定理

$$f(x+h, y+k) - f(x, y) = hf'_x(x+\theta h, y+\theta k) + kf'_y(x+\theta h, y+\theta k)$$

• 二元 Taylor 公式

$$f(x, y) = f(x_0 + h, y_0 + k) = \sum_{m=0}^n \frac{1}{m!} \left(h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^m f(x_0, y_0) + R_n,$$

$$R_n = \frac{1}{(n+1)!} \left(h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^{n+1} f(x_0 + \theta h, y_0 + \theta k) \quad (0 < \theta < 1)$$

$$f(x, y) = f(x_0, y_0) + (x - x_0) \frac{\partial f(x_0, y_0)}{\partial x} + (y - y_0) \frac{\partial f(x_0, y_0)}{\partial y} + R_1, \quad R_1 = o\left(\sqrt{(x - x_0)^2 + (y - y_0)^2}\right)$$

$$f(x, y) = f(x_0, y_0) + \frac{\partial f(x_0, y_0)}{\partial x} h + \frac{\partial f(x_0, y_0)}{\partial y} k + \frac{1}{2} (Ah^2 + 2Bhk + Ck^2) + R_2, \quad (\text{二阶})$$

$$A = \frac{\partial^2 f(x_0, y_0)}{\partial x^2}, B = \frac{\partial^2 f(x_0, y_0)}{\partial x \partial y}, C = \frac{\partial^2 f(x_0, y_0)}{\partial y^2}, \text{判别式 } \Delta = AC - B^2$$

- Lagrange 乘数法: $L(x, y, \lambda) = f(x, y) + \lambda \varphi(x, y), \frac{\partial L}{\partial x} = \frac{\partial L}{\partial y} = \frac{\partial L}{\partial \lambda} = 0$
- 旋度、散度、梯度 (以及不同坐标表示)

解题方略

- 1、证明关于隐函数的等式 (有中间变量的思想, 先将一二阶导数准备好再代入)

x, y, ξ, η 四个变量两两相关, 注意链式法则的完整性和顺序

2、善用全微分

3、

注意事项

- 1、二阶偏导会涉及到一二阶混合偏导, 注意二阶偏导中出现一阶偏导要将一阶偏导结果带入计算。
- 2、Lagrange 乘数法要讨论边界上是否可能取得极值, 并与内部极值比较

5 多变量积分学 总结

1、基本概念

• 二维

$$d\sigma = dx \, dy = \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du \, dv, \text{ 面积膨胀率 } \left| \frac{\partial(x, y)}{\partial(u, v)} \right|, \text{ 有时取倒数方便计算。}$$

$$x = r \cos \varphi, y = r \sin \varphi$$

$$\frac{\partial(x, y)}{\partial(r, \varphi)} = \begin{vmatrix} \cos \varphi & \sin \varphi \\ -r \sin \varphi & r \cos \varphi \end{vmatrix} = r$$

• 三维

$$dV = dx \, dy \, dz = \left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| du \, dv \, dw$$

$$\iiint_V f(x, y, z) dx \, dy \, dz = \iiint_{V'} f(x(u, v, w), y(u, v, w), z(u, v, w)) \left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| du \, dv \, dw$$

$$x = \rho \sin \varphi \cos \theta, y = \rho \sin \varphi \sin \theta, z = \rho \cos \varphi$$

$$\frac{\partial(x, y, z)}{\partial(\rho, \varphi, \theta)} = \rho^2 \sin \varphi \quad \text{球体常用}$$

$$\text{重心} \quad x_G = \frac{\iiint_V x \rho(x, y, z) dx \, dy \, dz}{\iiint_V \rho(x, y, z) dx \, dy \, dz}$$

$$\text{转动惯量} \quad I_x = \iiint_V (y^2 + z^2) \rho(x, y, z) dx \, dy \, dz$$

$$\text{引力} \quad \mathbf{F} = km \iiint_V \frac{\mathbf{r} - \mathbf{r}_0}{|\mathbf{r} - \mathbf{r}_0|^3} \rho(x, y, z) dx \, dy \, dz$$

• n 维

• n 维球的 Jacobi 行列式: 多重复合映射

• n 维单形的面积和体积 (递推算法)

$$S_n(a) = \{(x_1, \dots, x_n) : x_1, \dots, x_n \geq 0; x_1 + \dots + x_n \leq a\}$$

$$\sigma(S_n(1)) = \frac{1}{n} \sigma(S_{n-1}(1)), \sigma(S_n(1)) = \frac{1}{n!}, \sigma(S_n(a)) = \frac{a^n}{n!}$$

$$B_n(a) = \{(x_1, \dots, x_n) : x_1^2 + \dots + x_n^2 \leq a^2\}$$

$$V(B_n(1)) = \frac{2\pi}{n} V(B_{n-2}(1)), V(B_{2n}(a)) = \frac{\pi^n}{n!} a^{2n}, V(B_{2n-1}(a)) = \frac{2^n \pi^{n-1}}{(2n-1)!!} a^{2n-1}$$

$$\text{引入 } \Gamma \text{ 函数得到, } V(B_n(a)) = \frac{a^n \pi^{\frac{n}{2}}}{\Gamma(\frac{n}{2} + 1)}$$

• “第一型”积分: 长度; 面积

$$\text{线积分 } L: \vec{r}(t) = (x(t), y(t), z(t)) \in C^1[\alpha, \beta], \vec{r}'(t) \neq \vec{0}$$

导函数存在且连续, 切向量不为 0 (Riemann 和极限)

$$\text{弧长微元 } ds = \sqrt{x'^2(t) + y'^2(t) + z'^2(t)} dt,$$

$$\int_L f(x, y) ds = \int_a^b f(x, y(x)) \sqrt{1 + y'^2(x)} dx$$

$$\int_L f(x, y) ds = \int_\alpha^\beta f(r(\theta) \cos \theta, r(\theta) \sin \theta) \sqrt{r^2(\theta) + r'^2(\theta)} d\theta$$

$$\text{面积分 } \Sigma: \vec{r}(u, v) = (x(u, v), y(u, v), z(u, v)), \vec{r}'_u \times \vec{r}'_v \neq \vec{0}$$

$$\text{面积微元 } dS = |\vec{r}'_u \times \vec{r}'_v| du dv = \sqrt{EG - F^2} du dv$$

$$= \sqrt{1 + z'^2_x + z'^2_y} dxdy = \frac{\sqrt{F'^2_x + F'^2_y + F'^2_z}}{|F'_z|} dxdy$$

核心在于投影到二维平面，化成双参数；当 $z = 0$ 时，回到平面状态 $ds = dxdy$

• “第二型” 积分：做功；通量

$$L: I = \int_L \vec{F} \cdot d\vec{s} = \int_L (P, Q, R) \cdot (dx, dy, dz), d\vec{s} \text{ 有向弧长元}$$

$$\Sigma: \Phi = \iint_\Sigma \vec{A}(x, y, z) \cdot \vec{n} ds = \iint_\Sigma (P \cos \alpha + Q \cos \beta + R \cos \gamma) ds$$

$$(\text{投影}) = \iint_\Sigma (P, Q, R) \cdot (dydz, dzdx, dxdy), d\vec{s} \text{ 有向面积元}$$

$$(\text{三化一}) = \iint_{D_{xy}} \left(P \frac{\cos \alpha}{\cos \gamma} + Q \frac{\cos \beta}{\cos \gamma} + R \right) dxdy$$

• 三大公式

$$\text{Green: } \oint_L P dx + Q dy = \iint_S \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dxdy, \text{ 曲线积分的正向是 } L = \partial D \text{ 的逆时针方向}$$

$$\text{Gau\ss: } \iiint_V P dy dz + Q dz dx + R dx dy = \iiint_V \left(\frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} \right) dx dy dz$$

$$\begin{aligned} \text{Stokes: } \oint_L P dx + Q dy + R dz &= \iint_S \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) dy dz + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) dz dx + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy \\ &= \iint_S \begin{vmatrix} dy dz & dz dx & dx dy \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} \end{aligned}$$

• Green 公式的推论:

$$\text{Green 围的面积: } \sigma(S) = \oint_L x dy = - \oint_L y dx = \frac{1}{2} \oint_L x dy - y dx$$

Green I、II

$$\oint_{\partial\Omega} u \frac{\partial v}{\partial \mathbf{n}} ds = \iiint_\Omega (\nabla u \cdot \nabla v + u \Delta v) dxdydz$$

$$\oint_{\partial\Omega} \left(u \frac{\partial v}{\partial \mathbf{n}} - v \frac{\partial u}{\partial \mathbf{n}} \right) ds = \iiint_\Omega (u \Delta v - v \Delta u) dxdydz$$

补充:

$$\oint_L \frac{\partial u}{\partial \mathbf{n}} ds = \oint_L \left(\frac{\partial u}{\partial x} \cdot n_x + \frac{\partial u}{\partial y} \cdot n_y \right) ds = \oint_L \left(-\frac{\partial u}{\partial y}, \frac{\partial u}{\partial x} \right) \cdot \boldsymbol{\tau} ds$$

$$= \oint_L \frac{\partial u}{\partial x} dy - \frac{\partial u}{\partial y} dx = \iint_{D_1} \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) dx dy$$

$$\oint_L \mathbf{v} \cdot \mathbf{n} ds = \iint_{D_1} \left(\frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} \right) dx dy \quad (\mathbf{v} = (P, Q), \text{ 平面散度公式})$$

级数收敛和反常积分收敛的判定平行理论		
极限形式	$\sum_{i=1}^{\infty} a_i \text{ con} \Leftrightarrow \lim_{n \rightarrow \infty} \sum_{i=1}^n a_i \text{ 存在}$	$\int_a^{+\infty} f(x)dx \text{ con} \Leftrightarrow \lim_{b \rightarrow \infty} \int_a^b f(x)dx \text{ 存在}$
有上界	$\begin{aligned} &\text{正项级数 } \sum_{n=1}^{\infty} a_n \text{ con} \\ &\Leftrightarrow \text{部分和 } \sum_{i=1}^n a_i \text{ 有上界} \end{aligned}$	$\begin{aligned} &\int_a^{+\infty} f(x)dx \text{ con} \\ &\Leftrightarrow \text{部分积分 } \int_a^b f(x)dx \text{ 有上界} \end{aligned}$
比较法	$0 \leq a_n \leq b_n, \sum_{n=1}^{\infty} b_n \text{ con} \Rightarrow \sum_{n=1}^{\infty} a_n \text{ con}$	$0 \leq f(x) \leq g(x), \int_a^{\infty} g(x) \text{ con} \Rightarrow \int_a^{\infty} f(x) \text{ con}$
比较法 极限形式	$\begin{aligned} &0 \leq a_n, b_n, \lim_{n \rightarrow \infty} \frac{a_n}{b_n} = A_0 \\ &0 < A_0 < +\infty, \sum_{n=1}^{\infty} b_n, \sum_{n=1}^{\infty} a_n \text{ 同敛散} \\ &A_0 = 0, \sum_{n=1}^{\infty} b_n \text{ con}, \sum_{n=1}^{\infty} a_n \text{ con} \\ &A_0 = +\infty, \sum_{n=1}^{\infty} b_n \text{ div}, \sum_{n=1}^{\infty} a_n \text{ div} \end{aligned}$	$\begin{aligned} &0 \leq f(x), g(x), \lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = A_0 \\ &0 < A_0 < +\infty, \int_a^{+\infty} f(x)dx, \int_a^{+\infty} g(x)dx \text{ 同敛散} \\ &A_0 = 0, \int_a^{+\infty} g(x)dx \text{ con}, \int_a^{+\infty} f(x)dx \text{ con} \\ &A_0 = +\infty, \int_a^{+\infty} g(x)dx \text{ div}, \int_a^{+\infty} f(x)dx \text{ div} \end{aligned}$
Dirichlet	$\begin{aligned} &\sum_{i=1}^n a_i \text{ 对 } n \in N \text{ 有界, } b_n \text{ 单减趋零} \\ &\Rightarrow \sum_{n=1}^{\infty} a_n b_n \text{ con} \end{aligned}$	$\begin{aligned} &\int_a^b f(x)dx \text{ 对 } b > a \text{ 有界, } g(x) \text{ 单减趋零} \\ &\Rightarrow \int_a^{+\infty} f(x)g(x)dx \text{ con} \end{aligned}$
Abel	$\begin{aligned} &\sum_{n=1}^{\infty} a_n \text{ con, } b_n \text{ 单调有界} \\ &\Rightarrow \sum_{n=1}^{\infty} a_n b_n \text{ con} \end{aligned}$	$\begin{aligned} &\int_a^{+\infty} f(x)dx \text{ con 且 } g(x) \text{ 单调有界} \\ &\Rightarrow \int_a^{+\infty} f(x)g(x)dx \text{ con} \end{aligned}$
和函数	$\sum_{n=1}^{+\infty} a_n(x) = S(x)$	$\int_a^{+\infty} f(x, u)dx = g(u)$
p 级数/ p 积分	$\sum_{n=1}^{\infty} \frac{1}{n^p}, p > 1 \text{ con, } p \leq 1 \text{ div}$	第一类 p 积分: $\int_a^{+\infty} \frac{1}{x^p} dx, p > 1 \text{ con, } p \leq 1 \text{ div}$ 第二类 p 积分: $\int_a^b \frac{1}{(x-a)^p} dx, p < 1 \text{ con, } p \geq 1 \text{ div}$

含参变量常义积分的性质	
设 $g(u) = \int_a^b f(x, u) dx, u \in [\alpha, \beta], f(x, u) \in C(D)$ D: 参变量 $u \in [\alpha, \beta], x \in [a, b]$	
I	$g(u) \in C[\alpha, \beta], \lim_{u \rightarrow u_0} g(u) = g(u_0)$ $\Leftrightarrow \lim_{u \rightarrow u_0} \int_a^b f(x, u) dx = \int_a^b f(x, u_0) dx = \int_a^b \lim_{u \rightarrow u_0} f(x, u) dx$
II	$g(u)$ 在 $[\alpha, \beta]$ Riemann 可和 $\int_\alpha^\beta g(u) du = \int_\alpha^\beta \left(\int_a^b f(x, u) dx \right) du = \int_a^b \left(\int_\alpha^\beta f(x, u) du \right) dx$
III	$f(x, u), \frac{\partial f(x, u)}{\partial u} \in C(D)$ $\therefore g(u) \in C^1[\alpha, \beta], g'(u) = \left(\int_a^b f(x, u) dx \right)'_u = \int_a^b \frac{\partial f(x, u)}{\partial u} dx$
IV	$a(u), b(u) \in C[\alpha, \beta],$ 且 $a \leq a(u), b(u) \leq b, f(x, u) \in C(D)$ $g(u) = \int_{a(u)}^{b(u)} f(x, u) dx \in C[\alpha, \beta]$
V	$a(u), b(u) \in C^1[\alpha, \beta], a \leq a(u), b(u) \leq b, f(x, u), \frac{\partial f(x, u)}{\partial u} \in C(D)$ $g'(u) = \int_{a(u)}^{b(u)} \frac{\partial f(x, u)}{\partial u} dx + f(b(u), u)b'(u) - f(a(u), u)a'(u)$

• 含参变量积分的极限、求导可交换性：检查积分号下两个函数是否在定义域都连续 • 含参积分的计算方法：先求导再积分/引入参数构造/解微分方程/周期函数联想数列

$$\text{如: } I(u) = \int_0^1 \frac{\ln(1+ux)}{1+x^2} dx, \quad I(u) = \int_0^{+\infty} \frac{\sin x \sin ux}{x} e^{-\beta x} dx$$

• 含参积分的收敛性

证明不一致 con 时，可找出 $\varepsilon_0 > 0$ 、参数列 u_n 以及 $A_{2,n} > A_{1,n} \rightarrow +\infty$ ，使

$$\left| \int_{A_{1,n}}^{A_{2,n}} f(x, u_n) dx \right| \geq \varepsilon_0, \quad \text{即使用一致 Cauchy 准则的反面.}$$

(判定依赖于 A 和参数, 如 $\int_1^{+\infty} e^{-\frac{1}{\alpha^2}(x-\frac{1}{\alpha})^2} dx$ 在 $\alpha \in (0, 1)$ 一致 con, 积分小于 ε).

含参变量反常积分的收敛判定定理	
Cauchy	$\int_a^{+\infty} f(x, u) dx = \text{一致 con} = g(u), u \in [\alpha, \beta],$ $\Leftrightarrow \forall \varepsilon > 0 \exists A_0(\varepsilon) > a, \forall u \in [\alpha, \beta], \forall A_2 > A_1 > A_0(\varepsilon), \left \int_{A_1}^{A_2} f(x, u) dx \right < \varepsilon$
Weierstrass (最常用, 找一多项式比较)	$\exists h(x) \in C[a, +\infty), h(x) > 0, \int_a^{+\infty} h(x) dx \text{ con (优积分收敛)}$ $ f(x, u) \leq h(x), h(x) \text{ 是强函数}$ $\forall u \in [\alpha, \beta], \int_a^{+\infty} f(x, u) dx \text{ 一致 con}$
Dirichlet	$\forall b > a, \int_a^b f(x, u) dx \text{ 对于 } b, u \text{ 一致有界,}$ $\text{即 } \exists \text{ 与 } b, u \text{ 无关的 } M > 0, \left \int_a^b f(x, u) dx \right \leq M, \forall b > a, \forall u \in [\alpha, \beta]$ $\text{且 } h(x, u) \text{ 在 } D \text{ 中关于 } x \text{ 单调一致趋零}$ $\int_a^{+\infty} f(x, u) h(x, u) dx = \text{一致 con} = G(u)$
Abel	$\int_a^{+\infty} f(x, u) dx \text{ 一致 con, 且 } h(x, u) \text{ 在 } D \text{ 中关于 } x \text{ 单调、一致有界}$ $\text{即 } \exists \text{ 与 } u \text{ 无关的 } M > 0, h(x, u) \leq M, \forall u \in [\alpha, \beta]$ $\therefore \int_a^{+\infty} f(x, u) h(x, u) dx = \text{一致 con} = G(u)$

※ 注意：判定端点的趋向；若有多个瑕点，需要在每个瑕点附近分别讨论一致收敛性

$$\int_a^{+\infty} \frac{\sin mx}{x^\lambda} dx, \int_a^{+\infty} \frac{\cos mx}{x^\lambda} dx \quad \lambda > 1 : \text{abs con}, \quad 0 < \lambda \leq 1 : \text{条件 con} \quad \lambda \leq 0 : \text{div}$$

• 含参变量积分的可微：

(1) $f(x, u)$ 在区域 D ($x \in [a, b], u \in [\alpha, \beta]$) 上连续，且 D 中对 u 偏导数连续

$$\varphi'(u) = \int_a^b \frac{\partial f(x, u)}{\partial u} dx$$

(2) 在 (1) 条件中，加入 $a(u), b(u)$ 对 u 可导，则有

$$\psi'(u) = \int_{a(u)}^{b(u)} \frac{\partial f(x, u)}{\partial u} dx + f(b(u), u)b'(u) - f(a(u), u)a'(u)$$

(※ 证明 $\varphi(u)$ 连续性、可导，回归多元函数 f 及偏导函数连续性，若反常积分则先用 4 种判法证明一致 con 性质，再证明 f 的连续性)

• Dirichlet 积分 (Fourier 变换/积分法证明)

$$\int_0^\infty \frac{\sin x}{x} dx = \frac{\pi}{2}$$

$$\text{证明：构造本函数 } f(x) = \begin{cases} 0, & |x| > 1 \\ 1, & |x| \leq 1 \end{cases}$$

$$\text{Fourier 变换像函数 } F(\lambda) = \int_{-\infty}^{+\infty} f(t)e^{-i\lambda t} dt = \frac{2 \sin \lambda}{\lambda}, \text{ 在连续点 } x=0 \text{ 使用反演公式}$$

$$\text{还可以得到 } \int_0^{+\infty} \frac{\sin \beta x}{x} dx = \frac{\pi}{2} \cdot \text{sgn}(\beta) = \begin{cases} \frac{\pi}{2}, & \beta > 0 \\ 0, & \beta = 0 \\ -\frac{\pi}{2}, & \beta < 0 \end{cases}$$

• Poisson 积分

$$\int_{-\infty}^{+\infty} e^{-x^2} dx = \sqrt{\pi}$$

$$\text{证明：} \iint_{x^2+y^2 \leq R^2} e^{-x^2-y^2} dx dy = \int_0^{2\pi} d\varphi \int_0^R e^{-r^2} r dr = \pi (1 - e^{-R^2})$$

$$\left(\int_{-R}^R e^{-x^2} dx \right)^2 = \int_{-R}^R e^{-x^2} dx \int_{-R}^R e^{-y^2} dy = \iint_{[-R, R]^2} e^{-x^2-y^2} dx dy$$

$$\iint_{x^2+y^2 \leq R^2} e^{-x^2-y^2} dx dy \leq \left(\int_{-R}^R e^{-x^2} dx \right)^2 \leq \iint_{x^2+y^2 \leq 2R^2} e^{-x^2-y^2} dx dy$$

$$\text{一般地 } (a > 0), I = \int_{-\infty}^{+\infty} e^{-ax^2+bx+c} dx = \int_{-\infty}^{+\infty} e^{-a(x-\frac{b}{2a})^2 + \frac{b^2+4ac}{4a}} dx$$

$$= e^{\frac{b^2+4ac}{4a}} \int_{-\infty}^{+\infty} e^{-u^2} \frac{du}{\sqrt{a}} = \sqrt{\frac{\pi}{a}} e^{\frac{b^2+4ac}{4a}}$$

• Fresnel 积分

$$\begin{aligned}\int_0^{+\infty} \sin x^2 dx &= \int_0^{+\infty} \cos x^2 dx = \sqrt{\frac{\pi}{8}} \\ I &= \frac{1}{2} \int_0^{+\infty} \frac{\sin t}{\sqrt{t}} dt = \frac{1}{2} \int_0^{+\infty} \left(\frac{2}{\sqrt{\pi}} \int_0^{+\infty} e^{-tu^2} du \right) \sin t dt \\ &= \frac{1}{\sqrt{\pi}} \int_0^{+\infty} \frac{du}{u^4 + 1} = \sqrt{\frac{\pi}{8}}\end{aligned}$$

• Laplace 积分

$$\begin{aligned}I(\beta) &= \int_0^{+\infty} \frac{\cos \beta x}{\alpha^2 + x^2} dx \quad (\alpha > 0, \beta \geq 0), \\ J(\beta) &= \int_0^{+\infty} \frac{x \sin \beta x}{\alpha^2 + x^2} dx \quad (\alpha > 0, \beta > 0). \\ J(\beta) &= -I'(\beta) \\ I'(\beta) + \frac{\pi}{2} &= - \int_0^{+\infty} \frac{x \sin \beta x}{\alpha^2 + x^2} dx + \int_0^{+\infty} \frac{\sin \beta x}{x} dx = \alpha^2 \int_0^{+\infty} \frac{\sin \beta x}{x(x^2 + \alpha^2)} dx \\ \Rightarrow I''(\beta) &= \alpha^2 I(\beta), \quad \therefore I(\beta) = \frac{\pi}{2\alpha} e^{-\alpha\beta}, \quad J(\beta) = \frac{\pi}{2} e^{-\alpha\beta} \\ \text{还可以导出 } I(\beta) &= \int_0^{+\infty} e^{-x^2} \cos 2\beta x dx = \frac{\sqrt{\pi}}{2} e^{-\beta^2} \\ \text{以及 } \int_0^{+\infty} e^{-ax} \sin x dx &= \frac{1}{1+a^2} \quad (a > 0)\end{aligned}$$

• Euler 积分

 $\Gamma(x)$ $\Gamma'(x)$ 

$$\begin{aligned}\Gamma(s) &= \int_0^{+\infty} t^{s-1} e^{-t} dt \\ B(p, q) &= \int_0^1 t^{p-1} (1-t)^{q-1} dt\end{aligned}$$

★Euler 积分主要公式和性质

$$\begin{aligned}
\Gamma(x+1) &= x\Gamma(x), \Gamma(n+1) = n!, \Gamma(x)\Gamma(1-x) = \frac{\pi}{\sin \pi x} \\
\Gamma\left(n + \frac{1}{2}\right) &= \frac{(2n-1)!!}{2^n} \sqrt{\pi}, \Gamma(2x) = \frac{2^{2x-1}}{\sqrt{\pi}} \Gamma(x)\Gamma\left(x + \frac{1}{2}\right) \\
B(x, y) &= \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)} \\
B(x, y) &= B(y, x), B(x+1, y+1) = \frac{xy}{(x+y)(x+y+1)} B(x, y) \\
B(x, y) &= \int_0^{+\infty} \frac{z^{x-1}}{(1+z)^{x+y}} dz, B(x, y) = 2 \int_0^{\frac{\pi}{2}} \sin^{2x-1} \theta \cos^{2y-1} \theta d\theta \\
\Gamma(x)\zeta(x) &= \int_0^{+\infty} \frac{z^{x-1}}{e^z - 1} dz
\end{aligned}$$

2 解题方略:

①分割与填充、换元与换序

②对称性的应用: 奇偶对称、轮换对称。特别地, 积分域关于某平面/直线对称, 若被积函数关于同样的平面/直线对称 (对称变元不动), 若是偶函数则加倍, 奇函数则为零

③一个公式的多种写法, 证明题趋向构造, 观察、联想!

④划分区域、分块积分 (前后、左右、上下) 小技巧: 做出投影区域直观分析

⑤Green 补线法和挖洞法 (其中 ε 的取法) 以及 Stokes 公式法向量 $\vec{n}$ 的应用

※ 注意: 公式的先决条件的重要性; 书写规范完整

3、补充:

$$\text{Frullani 积分: } \int_0^{+\infty} \frac{f(ax) - f(bx)}{x} dx = (f(0) - f(+\infty)) \ln \frac{b}{a} \quad (a > 0, b > 0)$$

$$\begin{aligned}
\text{Poisson 公式: } & \int_0^{2\pi} d\theta \int_0^\pi f(a \sin \varphi \cos \theta + b \sin \varphi \sin \theta + c \cos \varphi) \sin \varphi d\varphi \\
&= 2\pi \int_{-1}^1 f(kz) dz \quad (k = \sqrt{a^2 + b^2 + c^2})
\end{aligned}$$

6 Fourier 级数 总结

1. 重要的公式

• Dirichlet Th:

汪: 分段光滑; 且只有第一类间断点

书: 若周期延拓连续且分段 C^1 , 则 Fourier 级数一致 con

$$f(x) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos n\omega x + b_n \sin n\omega x) = \frac{f(x+0) + f(x-0)}{2}$$

有限区间 $[a, b]$, $2l = b - a$, 故可以写作:

$$\text{若 } f(x) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos \frac{2n\pi}{b-a} x + b_n \sin \frac{2n\pi}{b-a} x \right)$$

$$a_n = \frac{2}{b-a} \int_a^b f(x) \cos \frac{2n\pi}{b-a} x \, dx, n = 0, 1, 2, \dots$$

$$b_n = \frac{2}{b-a} \int_a^b f(x) \sin \frac{2n\pi}{b-a} x \, dx, n = 1, 2, \dots$$

$$a_n = \frac{1}{l} \int_a^b f(x) \cos \frac{n\pi}{l} x \, dx, n = 0, 1, 2, \dots$$

$$a_n = \frac{1}{l} \int_a^b f(x) \cos n\omega x \, dx, n = 0, 1, 2, \dots, \omega = \frac{2\pi}{2l}$$

复数形式 ($T = 2l$) (利用 Euler 公式: $\cos n\omega x = \frac{e^{in\omega x} + e^{-in\omega x}}{2}$, $\sin n\omega x = \frac{e^{in\omega x} - e^{-in\omega x}}{2i}$)

$$f(x) \sim \sum_{n=-\infty}^{+\infty} F_n e^{in\omega x}$$

$$F_{\pm n} = \frac{1}{2l} \int_{-l}^l f(t) e^{\mp in\omega t} \, dt$$

• 内积和距离:

$$\|f - g\| = \sqrt{\langle f - g, f - g \rangle} = \sqrt{\int_a^b [f(x) - g(x)]^2 \, dx}$$

• Bessel 不等式与 Parseval 等式 ($\Delta_n = \|f - g_n\|^2$ 在 Fourier 部分和处最小): 若 $f \in L^2[-l, l]$, 则

$$\frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \frac{1}{l} \int_{-l}^l f^2(x) \, dx$$

(注意第一项 $\frac{a_0^2}{2}$! ★ Parseval 等式意义: 实现离散求和/连续求和的互化, 条件只需要均方收敛)

• 广义 Fourier 级数

• 均方收敛: $\|g_n - f\|_2 \rightarrow 0$ 。它一般不推出整个序列逐点或几乎处处收敛, 但可选出一个几乎处处收敛到 f 的子列。

- 三种收敛的关系

- Fourier 积分

$$f(x) \sim \frac{1}{\pi} \int_0^{+\infty} d\lambda \int_{-\infty}^{+\infty} f(t) \cos \lambda(x-t) dt = \frac{f(x+0) + f(x-0)}{2}, -\infty < x < +\infty$$

$$f(x) \sim \int_0^{+\infty} [A(\lambda) \cos \lambda x + B(\lambda) \sin \lambda x] d\lambda$$

$$A(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \cos \lambda t dt, B(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \sin \lambda t dt$$

$$f(x) \sim \frac{1}{2\pi} \int_{-\infty}^{+\infty} e^{i\lambda x} d\lambda \int_{-\infty}^{+\infty} f(t) e^{-i\lambda t} dt$$

- Fourier 变换

$$\text{像函数: } F(\lambda) = \int_{-\infty}^{+\infty} f(t) e^{-i\lambda t} dt$$

$$\text{反演公式: } f(x) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} F(\lambda) e^{i\lambda x} d\lambda$$

复数形式:

$$f(x) \sim \sum_{n=-\infty}^{\infty} F_n e^{in\omega x}, \quad \omega = \frac{\pi}{l}, \quad F_{-n} = \bar{F}_n \quad (f \text{ 为实值函数})$$

$$F_{\pm n} = \frac{1}{2l} \int_{-l}^l f(x) e^{\mp in\omega x} dx \quad (n = 0, 1, 2, 3, \dots), \quad |e^{\mp in\omega x}|^2 = 1, \quad \int_{-l}^l |e^{\mp in\omega x}|^2 dx = 2l$$

- 特性

$$F[\alpha f + \beta g] = \alpha F[f] + \beta F[g] \quad (\text{线性性质})$$

$$F[f(x) e^{-i\lambda_0 x}] = F(\lambda + \lambda_0) \quad (\text{频移特性})$$

$$F[f^{(n)}(x)] = (i\lambda)^n F[f(x)] \quad (\text{微分关系})$$

• 卷积

$$(f * g)(x) = \int_{-\infty}^{+\infty} f(x-t)g(t)dt$$

$$F(f * g) = F(\lambda) \cdot G(\lambda)$$

$$F^{-1}(F(f * g)) = f * g = \int_{-\infty}^{+\infty} f(x-t)g(t)dt$$

• Fourier 变换的 Parseval 等式:

$$\int_{-\infty}^{+\infty} |f(x)|^2 dx = \frac{1}{2\pi} \int_{-\infty}^{+\infty} |F(\lambda)|^2 d\lambda$$

2、重要概念推导

(1) 正交系 & 标准正交系

三角函数系 $\{1, \cos \omega x, \sin \omega x, \dots, \cos n\omega x, \sin n\omega x, \dots\}$ 是区间 $[-l, l]$ 上的正交系 Legendre 函数 $\in L^2[-1, 1]$, 证明正交系 (书例题)

$$P_n(x) = \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n \quad (n = 0, 1, 2, \dots)$$

3、题型小结

(1) 作图、展开

①奇/偶/周期延拓, 对应正余弦级数 ②求 a_0, a_n, b_n ③利用 Dirichlet con Th

(2) 求值、计算 (结合数列、积分知识、联想 Parseval 等式)

给出一些参考积分公式

(3) 利用 Fourier 变换/积分证明 (不) 等式

4、补充

• 收敛性的证明 (《数学分析讲义》P280)

• 常用积分公式 (学会推导)

$$\begin{aligned} \int x \sin ax dx &= \frac{\sin ax - ax \cos ax}{a^2} \\ \int x \cos bx dx &= \frac{\cos bx + bx \sin bx}{b^2} \\ \int x^2 \cos bxdx &= \frac{(b^2 x^2 - 2) \sin bx + 2bx \cos bx}{b^3} \\ \int x^2 \sin ax dx &= \frac{(2 - a^2 x^2) \cos ax + 2ax \sin ax}{a^3} \\ \int e^x \sin ax dx &= \frac{e^x (\sin ax - a \cos ax)}{a^2 + 1} \\ \int e^{ax} \cos bxdx &= \frac{e^{ax} (a \cos bx + b \sin bx)}{a^2 + b^2} \\ \int \sin ax \cos bxdx &= \frac{-b \sin ax \sin bx - a \cos ax \cos bx}{a^2 - b^2} \quad (a^2 \neq b^2) \end{aligned}$$

• 常用 Fourier 级数

$$\begin{aligned}
\sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\cos(2n-1)x}{(2n-1)^2} &= -x + \frac{\pi}{2} \Rightarrow \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} = \frac{\pi^2}{8} \\
\sum_{n=1}^{\infty} \frac{1}{n^2} &= \frac{\pi^2}{6} \left(\frac{\pi^2}{8} + \frac{S}{4} = S \right), \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} = \frac{\pi^2}{12} \\
\sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\sin(2n-1)x}{(2n-1)^3} &= \frac{\pi}{2}x - \frac{x^2}{2}, \sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\cos(2n-1)x - 1}{(2n-1)^4} = \frac{x^3}{6} - \frac{\pi x^2}{4} \\
\sum_{n=1}^{\infty} \frac{1}{(2n-1)^4} &= \frac{\pi^4}{96}, \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90}, \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^4} = \frac{7\pi^4}{720}
\end{aligned}$$

7 数学分析学习资源

科大网站:

- 跟锦数学 (习题分享)

8 空间解析几何

8.1 习题 向量与坐标系

1. 证明性质 2.

性质 2 设 λ, μ 是实数, $\mathbf{a}, \mathbf{b}$ 是向量, 则 $\lambda(\mathbf{a}+\mathbf{b})=\lambda\mathbf{a}+\lambda\mathbf{b}$; $(\lambda+\mu)\mathbf{a}=\lambda\mathbf{a}+\mu\mathbf{a}$; $(\lambda\mu)\mathbf{a}=(\lambda)\mu\mathbf{a}$

证明: 利用定义、平行四边形法则, 并参考向量加法性质的证明。

- (a) 由于向量 $\mathbf{a}$ 数乘 λ 定义为 $\lambda\mathbf{a}$, 这个新向量大小为 $|\lambda||\mathbf{a}|$; 当 $\lambda > 0$ 时方向同向量 $\mathbf{a}$, 当 $\lambda < 0$ 时方向相反, 故性质 2 第三条易得。
- (b) 关于第二条 $(\lambda+\mu)\mathbf{a}=\lambda\mathbf{a}+\mu\mathbf{a}$ 这是向量数乘第一分配律。下面给出证明: 如果 $\mathbf{a}=\mathbf{0}$ 或 $\lambda+\mu, \mu, \lambda$ 中至少有一个为零, 那么等式显然成立, 因此只需证明当 $\mathbf{a} \neq \mathbf{0}$, $\lambda+\mu \neq 0$, $\lambda\mu \neq 0$ 的情形。

i. 如果 $\lambda\mu > 0$, 则 $(\lambda+\mu)\mathbf{a}$, $\lambda\mathbf{a}$, $\mu\mathbf{a}$ 同向, 因此有

$$(\lambda+\mu)\mathbf{a}=|\lambda+\mu||\mathbf{a}|=(|\lambda|+|\mu|)|\mathbf{a}|=|\lambda||\mathbf{a}|+|\mu||\mathbf{a}|=|\lambda\mathbf{a}|+|\mu\mathbf{a}|=|\lambda\mathbf{a}+\mu\mathbf{a}|$$

故 $(\lambda+\mu)\mathbf{a}=\lambda\mathbf{a}+\mu\mathbf{a}$.

ii. 如果 $\lambda\mu < 0$, 不失一般性, 不妨设 $\lambda > 0, \mu < 0$, 再讨论 $\lambda+\mu > 0$ 和 $\lambda+\mu < 0$ 两种情形。下面只证明前一种情形。

设 $\lambda > 0, \mu < 0, \lambda+\mu > 0$, 这时 $-\mu > 0$, 因 $\lambda+\mu > 0$, 由 (1) 有:

$$(\lambda+\mu)\mathbf{a}+(-\mu)\mathbf{a}=[(\lambda+\mu+(-\mu))]\mathbf{a}=\lambda\mathbf{a}, \text{ 所以 } \lambda+\mu\mathbf{a}=\lambda\mathbf{a}-(-\mu)\mathbf{a}=\lambda\mathbf{a}+\mu\mathbf{a}.$$

(c) 最后完成第一条性质证明。

如果 $\lambda=0$ 或 $\mathbf{a}, \mathbf{b}$ 之中有一个为 $\mathbf{0}$, 等式显然成立。下面证明 $\lambda \neq 0, \mathbf{a} \neq \mathbf{0}, \mathbf{b} \neq \mathbf{0}$.

- i. 若 $\mathbf{a}, \mathbf{b}$ 共线, 当 $\mathbf{a}, \mathbf{b}$ 同向时, 取 $m=\frac{|\mathbf{a}|}{|\mathbf{b}|}$; 当 $\mathbf{a}, \mathbf{b}$ 反向时, $m=-\frac{|\mathbf{a}|}{|\mathbf{b}|}$, 显然有 $\mathbf{a}=m\mathbf{b}$. 于是有 $\lambda(\mathbf{a}+\mathbf{b})=\lambda[(m+1)\mathbf{b}]=[\lambda(m+1)]\mathbf{b}=(\lambda m+\lambda)\mathbf{b}=(\lambda m)\mathbf{b}+\lambda\mathbf{b}=\lambda(m\mathbf{b})+\lambda\mathbf{b}=\lambda\mathbf{a}+\lambda\mathbf{b}$.
- ii. 若 $\mathbf{a}, \mathbf{b}$ 不共线, 由相似三角形和向量平行四边形法则合成, 即可证明: $\lambda(\mathbf{a}+\mathbf{b})=\lambda\mathbf{a}+\lambda\mathbf{b}$, 这被称为向量数乘第二分配律。□

2. 证明性质 4 的 1、2

性质 4 1° $(\lambda \mathbf{a}) \times \mathbf{b} = \mathbf{a} \times (\lambda \mathbf{b}) = \lambda(\mathbf{a} \times \mathbf{b})$, 这里 λ 是一个实数

2° $\mathbf{a} \times \mathbf{b} = -\mathbf{b} \times \mathbf{a}$. (反称性)

证明: 由向量积的坐标行列式表示, 各分量都对每个因子线性, 因此 $(\lambda \mathbf{a}) \times \mathbf{b} = \mathbf{a} \times (\lambda \mathbf{b}) = \lambda(\mathbf{a} \times \mathbf{b})$ 。交换行列式的两行会改变符号, 故 $\mathbf{a} \times \mathbf{b} = -\mathbf{b} \times \mathbf{a}$; 几何上二者大小相等、方向相反。□

3. 判断下列结论是否成立, 并举例说明: (1) 若 $\mathbf{a} \cdot \mathbf{b} = 0$, 则 $\mathbf{a} = \mathbf{0}$ 或 $\mathbf{b} = \mathbf{0}$. (2) 若 $\mathbf{a} \times \mathbf{c} = \mathbf{a} \times \mathbf{b}$, 则必有 $\mathbf{c} = \mathbf{b}$. (3) 两单位向量的数量积必等于 1, 向量积必等于一单位向量. (4) $(\mathbf{a} \cdot \mathbf{b})\mathbf{c} = \mathbf{a}(\mathbf{b} \cdot \mathbf{c})$ (5) $|\mathbf{a} \cdot \mathbf{b}|^2 = |\mathbf{a}|^2 \cdot |\mathbf{b}|^2$. (6) $(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} + \mathbf{b}) = \mathbf{a} \times \mathbf{a} + 2\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{b}$.

(1) 不成立, 只能说明两向量垂直, (2) 不成立, 只能推出 $\mathbf{a} \times (\mathbf{c} - \mathbf{b}) = \mathbf{0}$, 例如 $\mathbf{a} = (1, 0, 0), \mathbf{b} = \mathbf{0}, \mathbf{c} = (1, 0, 0)$; (3) 不成立, 举坐标系和相同向量例子, (4) 不成立, 向量点乘得到是数值, (5) 不成立, 两个向量可能有夹角, (6) 不成立, 向量和自己的向量积为 0。

4. 证明 $\mathbf{a} \times \mathbf{b} \cdot \mathbf{c} = \mathbf{b} \times \mathbf{c} \cdot \mathbf{a} = \mathbf{c} \times \mathbf{a} \cdot \mathbf{b}$.

证明: 设 $\mathbf{a} = (a_1, a_2, a_3), \mathbf{b} = (b_1, b_2, b_3), \mathbf{c} = (c_1, c_2, c_3)$

$$\mathbf{a} \times \mathbf{b} \cdot \mathbf{c} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \begin{vmatrix} b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \\ a_1 & a_2 & a_3 \end{vmatrix} = \mathbf{b} \times \mathbf{c} \cdot \mathbf{a} = \begin{vmatrix} c_1 & c_2 & c_3 \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = \mathbf{c} \times \mathbf{a} \cdot \mathbf{b}$$

□

5. 设 $\overrightarrow{AM} = \overrightarrow{MB}$, 证明: 对任意一点 O ,

$$\overrightarrow{OM} = \frac{1}{2}(\overrightarrow{OA} + \overrightarrow{OB})$$

证明:

$$\begin{aligned} \because \overrightarrow{AM} &= \overrightarrow{MB} \Rightarrow \overrightarrow{OM} - \overrightarrow{OA} = \overrightarrow{OB} - \overrightarrow{OM} \\ \therefore \overrightarrow{OM} &= \frac{1}{2}(\overrightarrow{OA} + \overrightarrow{OB}) \end{aligned}$$

□

6. 设 $\mathbf{a}, \mathbf{b}, \mathbf{c}$ 是满足 $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ 的单位向量, 试求 $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$ 的值.

解: 联想平方关系, 得到 $(\mathbf{a} + \mathbf{b} + \mathbf{c})^2 = 0 = |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 + 2(\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a})$

$$\therefore \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} = -\frac{3}{2}$$

7. 若向量 $\mathbf{a} + 3\mathbf{b}$ 垂直于向量 $7\mathbf{a} - 5\mathbf{b}$, 向量 $\mathbf{a} - 4\mathbf{b}$ 垂直于向量 $7\mathbf{a} - 2\mathbf{b}$, 求两向量 $\mathbf{a}$ 和 $\mathbf{b}$ 间的夹角.

解: 由题意,

$$\begin{cases} (\mathbf{a} + 3\mathbf{b}) \cdot (7\mathbf{a} - 5\mathbf{b}) = 0 \\ (\mathbf{a} - 4\mathbf{b}) \cdot (7\mathbf{a} - 2\mathbf{b}) = 0 \end{cases} \Rightarrow \begin{cases} 7|\mathbf{a}|^2 + 16\mathbf{a} \cdot \mathbf{b} - 15|\mathbf{b}|^2 = 0 \\ 7|\mathbf{a}|^2 - 30\mathbf{a} \cdot \mathbf{b} + 8|\mathbf{b}|^2 = 0 \end{cases}$$

$$\therefore |\mathbf{b}|^2 = 2\mathbf{a} \cdot \mathbf{b}, \quad |\mathbf{a}|^2 = |\mathbf{b}|^2$$

$$\therefore \cos\langle \mathbf{a}, \mathbf{b} \rangle = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|} = \frac{1}{2}, \quad \text{故两向量夹角为 } \frac{\pi}{3}$$

8. 已知向量 $\mathbf{a}$ 和 $\mathbf{b}$ 互相垂直, 且 $|\mathbf{a}| = 3, |\mathbf{b}| = 4$, 试计算:

(1) $|(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})|$; (2) $|(3\mathbf{a} - \mathbf{b}) \times (\mathbf{a} - 2\mathbf{b})|$

解:

$$\begin{aligned} \text{设 } \mathbf{a} &= (3, 0), \mathbf{b} = (0, 4) \\ |(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})| &= |(3, 4) \times (3, -4)| = 24 \\ |(3\mathbf{a} - \mathbf{b}) \times (\mathbf{a} - 2\mathbf{b})| &= |(9, -4) \times (3, -8)| = 60 \end{aligned}$$

9. 已知向量 $\mathbf{a}$ 和 $\mathbf{b}$ 的夹角 $\theta = \frac{2\pi}{3}$, 又 $|\mathbf{a}| = 1, |\mathbf{b}| = 2$, 试计算:
(1) $|\mathbf{a} \times \mathbf{b}|^2$; (2) $|(\mathbf{a} + 3\mathbf{b}) \times (3\mathbf{a} - \mathbf{b})|^2$

解:

$$\begin{aligned} \text{设 } \mathbf{a} &= (1, 0), \mathbf{b} = (-1, \sqrt{3}) \\ |\mathbf{a} \times \mathbf{b}|^2 &= |\sqrt{3}|^2 = 3 \\ |(\mathbf{a} + 3\mathbf{b}) \times (3\mathbf{a} - \mathbf{b})|^2 &= |(-2, 3\sqrt{3}) \times (4, -\sqrt{3})|^2 = 300 \end{aligned}$$

10. 已知 $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$, 试证 $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$

证明: 要证明 $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$, 根据轮换对称性, 只需证 $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c}$,

$$\begin{aligned} \because \mathbf{c} &= -(\mathbf{a} + \mathbf{b}) \\ \Rightarrow \mathbf{a} \times \mathbf{b} &= (\mathbf{a} + \mathbf{b}) \times \mathbf{b} = (-\mathbf{c}) \times \mathbf{b} = \mathbf{b} \times \mathbf{c} \end{aligned}$$

□

11. 已知 $\mathbf{a}, \mathbf{b}, \mathbf{c}$ 不共线, 且 $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$, 求证: $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$.

证明:

$$\begin{aligned} \because \mathbf{a} \times \mathbf{b} - \mathbf{b} \times \mathbf{c} &= \mathbf{0} \Rightarrow (\mathbf{a} + \mathbf{c}) \times \mathbf{b} = \mathbf{0} \\ \therefore (\mathbf{a} + \mathbf{b} + \mathbf{c}) \times \mathbf{b} &= \mathbf{0}. \text{同理 } (\mathbf{a} + \mathbf{b} + \mathbf{c}) \times \mathbf{c} = \mathbf{0}. \\ \text{因 } \mathbf{b}, \mathbf{c} &\text{ 不共线, 故 } \mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0} \end{aligned}$$

□

12. 求证: $|\mathbf{a} \times \mathbf{b}|^2 = |\mathbf{a}|^2 |\mathbf{b}|^2 - (\mathbf{a} \cdot \mathbf{b})^2$.

证明:

$$\begin{aligned} |\mathbf{a} \times \mathbf{b}|^2 &= (|\mathbf{a}| |\mathbf{b}| \sin \theta)^2 = |\mathbf{a}|^2 |\mathbf{b}|^2 (1 - \cos^2 \theta) \\ &= |\mathbf{a}|^2 |\mathbf{b}|^2 - (\mathbf{a} \cdot \mathbf{b})^2 \end{aligned}$$

□

13. 计算以向量 $\mathbf{a} = \mathbf{p} - 3\mathbf{q} + \mathbf{r}$, $\mathbf{b} = 2\mathbf{p} + \mathbf{q} - 3\mathbf{r}$, 和 $\mathbf{c} = \mathbf{p} + 2\mathbf{q} + \mathbf{r}$ 为棱的平行六面体的体积, 这里 $\mathbf{p}, \mathbf{q}$ 和 $\mathbf{r}$ 是互相垂直的单位向量.

$$\text{解: } V = |(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}| = \begin{vmatrix} 1 & -3 & 1 \\ 2 & 1 & -3 \\ 1 & 2 & 1 \end{vmatrix} = 25$$

14. 已知 $\mathbf{a} = (3, -5, 8)$, $\mathbf{b} = (-1, 1, -4)$, 求 $\mathbf{a} - \mathbf{b}$ 的模和方向余弦.

$$\begin{aligned} \text{解: } \quad \mathbf{a} - \mathbf{b} &= (4, -6, 12), \\ \therefore |\mathbf{a} - \mathbf{b}| &= 14, \quad \cos \alpha = \frac{2}{7}, \cos \beta = -\frac{3}{7}, \cos \gamma = \frac{6}{7} \end{aligned}$$

15. 已知 $\mathbf{a} = 3\mathbf{i} + 4\mathbf{j} - 12\mathbf{k}$, 求 $\mathbf{a}$ 方向的单位向量 $\mathbf{a}^0$ 的坐标.

$$\text{解: } \mathbf{a}^0 = \left(\frac{3}{13}, \frac{4}{13}, -\frac{12}{13} \right)$$

16. 已知向量 $\mathbf{a}$ 与 x 轴和 y 轴所夹的角分别是 $\alpha = 60^\circ$, $\beta = 120^\circ$, 且 $|\mathbf{a}| = 2$, 试求 $\mathbf{a}$ 的坐标.

$$\text{解: } \mathbf{a} = (1, -1, \pm\sqrt{2})$$

17. 已知 $\overrightarrow{OA} = 2\mathbf{i} + 4\mathbf{j} + \mathbf{k}$, $\overrightarrow{OB} = 3\mathbf{i} + 7\mathbf{j} + 5\mathbf{k}$, $\overrightarrow{OC} = 4\mathbf{i} + 10\mathbf{j} + 9\mathbf{k}$, 问 A, B, C 三点是否共线?

$$\text{解: } \because \overrightarrow{AB} = \overrightarrow{BC} = (1, 3, 4), \text{ 故可以由向量共线推出三点共线}$$

18. 已知 $\mathbf{a}, \mathbf{b}$ 的夹角 $\theta = \frac{2\pi}{3}$, 且 $|\mathbf{a}| = 3, |\mathbf{b}| = 4$, 计算:
(1) $\mathbf{a} \cdot \mathbf{b}$ (2) $(3\mathbf{a} - 2\mathbf{b}) \cdot (\mathbf{a} + 2\mathbf{b})$.

$$\begin{aligned}\text{解: } \mathbf{a} \cdot \mathbf{b} &= 3 \times 4 \times \left(-\frac{1}{2}\right) = -6 \\ (3\mathbf{a} - 2\mathbf{b}) \cdot (\mathbf{a} + 2\mathbf{b}) &= 3|\mathbf{a}|^2 - 4|\mathbf{b}|^2 + 4\mathbf{a} \cdot \mathbf{b} = -61\end{aligned}$$

19. 已知 $\mathbf{a} = (4, -2, 4)$, $\mathbf{b} = (6, -3, 2)$, 试计算:

(1) $\mathbf{a} \cdot \mathbf{b}$ (2) $\sqrt{\mathbf{b} \cdot \mathbf{b}}$; (3) $(2\mathbf{a} - 3\mathbf{b}) \cdot (\mathbf{a} + 2\mathbf{b})$; (4) $|\mathbf{a} - \mathbf{b}|^2$.

解:

$$\begin{aligned}\mathbf{a} \cdot \mathbf{b} &= 4 \times 6 + (-2) \times (-3) + 4 \times 2 = 38 \\ \sqrt{\mathbf{b} \cdot \mathbf{b}} &= |\mathbf{b}| = \sqrt{6^2 + 3^2 + 2^2} = 7 \\ (2\mathbf{a} - 3\mathbf{b}) \cdot (\mathbf{a} + 2\mathbf{b}) &= (-10, 5, 2) \cdot (16, -8, 8) = -184 \\ |\mathbf{a} - \mathbf{b}|^2 &= |(-2, 1, 2)|^2 = 9\end{aligned}$$

20. 求向量 $\mathbf{a} = (2, -4, 4)$ 和 $\mathbf{b} = (-3, 2, 6)$ 的夹角的余弦.

$$\text{解: } \cos\langle \mathbf{a}, \mathbf{b} \rangle = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|} = \frac{10}{6 \cdot 7} = \frac{5}{21}$$

21. 试求向量 $\mathbf{a} = (5, 2, 5)$ 在向量 $\mathbf{b} = (2, -1, 2)$ 上的投影长, 即求数值 $\mathbf{a} \cdot \mathbf{e}_b$.

$$\text{解: } \mathbf{a} \cdot \mathbf{e}_b = |\mathbf{a}| \cdot \cos\langle \mathbf{a}, \mathbf{b} \rangle = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|} = \frac{18}{3} = 6$$

22. 已知向量 $\mathbf{a} = (3, -1, -2)$ 和 $\mathbf{b} = (1, 2, -1)$, 试求下列向量积的坐标:

(1) $\mathbf{a} \times \mathbf{b}$ (2) $(2\mathbf{a} - \mathbf{b}) \times (2\mathbf{a} + \mathbf{b})$

$$\begin{aligned}\text{解: } \mathbf{a} \times \mathbf{b} &= (3, -1, -2) \times (1, 2, -1) = (5, 1, 7) \\ (2\mathbf{a} - \mathbf{b}) \times (2\mathbf{a} + \mathbf{b}) &= (5, -4, -3) \times (7, 0, -5) = (20, 4, 28)\end{aligned}$$

23. 已知点 $A(1, 2, 0)$, $B(3, 0, -3)$, $C(5, 2, 6)$, 求三角形 ABC 的面积.

解: $\because (\overrightarrow{AB} \times \overrightarrow{BC}) \cdot \overrightarrow{AC} = 0$ 故三点共面, 且共面方程为 $3x + 6y - 2z = 15$ (或者三向量可以互相线性表示证明共面)

$$S_{\triangle ABC} = \frac{1}{2} |\overrightarrow{AB} \times \overrightarrow{AC}| = \frac{1}{2} |(2, -2, -3) \times (4, 0, 6)| = |(-6, -12, 4)| = 14$$

24. 计算顶点为 $A(2, -1, 1)$, $B(5, 5, 4)$, $C(3, 2, -1)$, $D(4, 1, 3)$ 的四面体的体积.

解: 四点构成的四面体体积等于对应平行六面体体积的 $\frac{1}{6}$, 且下面的混合积非零, 所以四点不共面:

$$V = \frac{1}{6} |(\overrightarrow{AB} \times \overrightarrow{AC}) \cdot \overrightarrow{AD}| = \frac{1}{6} \begin{vmatrix} 3 & 6 & 3 \\ 1 & 3 & -2 \\ 2 & 2 & 2 \end{vmatrix} = 3$$

25. 判断下列向量 $\mathbf{a}, \mathbf{b}, \mathbf{c}$ 是否共面?

(1) $\mathbf{a} = (2, 3, -1), \mathbf{b} = (1, -1, 3), \mathbf{c} = (1, 9, -11)$; (2) $\mathbf{a} = (3, -2, 1), \mathbf{b} = (2, 1, 2), \mathbf{c} = (3, -1, -2)$

解:

$$\because \mathbf{a} \times \mathbf{b} \cdot \mathbf{c} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

$$\begin{vmatrix} 2 & 3 & -1 \\ 1 & -1 & 3 \\ 1 & 9 & -11 \end{vmatrix} = 0, \text{ 所以第一组向量共面, } \begin{vmatrix} 3 & -2 & 1 \\ 2 & 1 & 2 \\ 3 & -1 & -2 \end{vmatrix} = -25, \text{ 所以第二组向量不共面}$$

26. 下列四点: $A(1, 2, -1), B(0, 1, 5), C(-1, 2, 1), D(2, 1, 3)$ 是否在一个平面上?

解: 判断平行六面体体积是否为 0,

$$\because (\overrightarrow{AB} \times \overrightarrow{AC}) \cdot \overrightarrow{AD} = \begin{vmatrix} -1 & -1 & 6 \\ -2 & 0 & 2 \\ 1 & -1 & 4 \end{vmatrix} = 0, \quad \text{所以 A,B,C,D 四点共面 } (x + 5y + z = 10)$$

27. (1) 求定点 $A(a, b, c)$, 求它关于三个坐标平面对称点的坐标; (2) 求定点 (a, b, c) 关于三个坐标轴对称点的坐标.

解: (1) 关于 XoY 平面对称点 $(a, b, -c)$; 关于 YoZ 平面对称点 $(-a, b, c)$; 关于 ZoX 平面对称点 $(a, -b, c)$

(2) 关于 x 轴对称点 $(a, -b, -c)$; 关于 y 轴对称点 $(-a, b, -c)$; 关于 z 轴对称点 $(-a, -b, c)$

28. 求点 $P(4, -3, 5)$ 到坐标原点以及到各坐标轴的距离.

解: 到原点距离: $5\sqrt{2}$; 到 x 轴: $\sqrt{34}$; 到 y 轴: $\sqrt{41}$; 到 z 轴: 5。

29. 在 yz 平面上求一点 P , 使它与三已知点 $A(3, 1, 2), B(4, -2, -2)$ 及 $C(0, 5, 1)$ 等距离.

$$\begin{aligned} \text{解: 设 } P &= (0, y, z), & |AP|^2 &= 9 + (1 - y)^2 + (2 - z)^2 \\ & & |BP|^2 &= 16 + (2 + y)^2 + (2 + z)^2 \\ & & |CP|^2 &= (5 - y)^2 + (1 - z)^2 \\ \because |AP| &= |BP| = |CP| \Rightarrow y = 1, z = -2, \therefore P(0, 1, -2) \end{aligned}$$

8.2 习题 平面和直线

1. 指出下列平面位置的特点, 并作图. (1) $2x + 2y + 2z = -1$; (2) $3x - 3y + 2 = 0$; (3) $y - 3z = 0$; (4) $3x - 2 = 0$

$2x + 2y + 2z = -1$, 与三个坐标轴截距均为 $-\frac{1}{2}$

$3x - 3y + 2 = 0$, 平行于 z 轴

$y - 3z = 0$, 平行于 x 轴

$3x - 2 = 0$, 垂直于 XoY 平面, 平行 y 轴, z 轴

2. 试求通过点 $M_1(2, -1, 3)$ 和 $M_2(3, 1, 2)$ 且平行于向量 $\mathbf{v} = (3, -1, 4)$ 的平面的方程.

解: 设平面法向量 $\mathbf{n} = (a, b, c)$, $\overrightarrow{M_1M_2} = (1, 2, -1)$

$$\therefore \begin{cases} \mathbf{n} \cdot \overrightarrow{M_1M_2} = 0 \\ \mathbf{n} \cdot \mathbf{v} = 0 \end{cases} \Rightarrow \begin{cases} a + 2b - c = 0 \\ 3a - b + 4c = 0 \end{cases}$$

$$\therefore \mathbf{n} \parallel (1, -1, -1),$$

$$\Rightarrow (x - 2) - (y + 1) - (z - 3) = 0$$

$$\therefore \text{平面方程为: } x - y - z = 0$$

3. 设平面通过点 $(5, -7, 4)$ 且在 x, y, z 三轴上的截距相等, 求平面方程.

解: 三坐标轴截距相等意味着法向量 $\mathbf{n} = (1, 1, 1)$, $\therefore$ 平面方程为: $(x - 5) + (y + 7) + (z - 4) = 0$

4. 试判断下列方程组中各组平面的位置关系 (平行, 重合, 相交, 垂直). (1) $2x - 3y + 5z - 7 = 0$ 与 $2x - 3y + 5z + 3 = 0$; (2) $4x + 2y - 4z + 5 = 0$ 与 $2x + y + 2z - 1 = 0$ (3) $x - 3z + 2 = 0$ 与 $2x - 6z + 4 = 0$; (4) $3x - y - 2z - 5 = 0$ 与 $x + 9y - 3z + 2 = 0$

解: (1) 平行; (2) 相交; (3) 重合; (4) 垂直

5. 求通过点 $M(3, -1, 1)$ 且同时垂直于两个平面 $2x - z + 1 = 0$ 和 $y = 0$ 的平面方程.

解: 两个平面的相交直线的方向向量为 $\mathbf{s} = (2, 0, -1) \times (0, 1, 0) = (1, 0, 2)$, 这就是所求平面的法向量

$$\therefore \text{所求平面为 } \Pi: x - 3 + 0(y + 1) + 2(z - 1) = 0$$

6. 求通过点 $M(-5, 2, -1)$ 且平行于坐标面 Oyz 的平面的方程.

$$\text{解: } x = -5$$

7. 求下列各对平面的夹角: (1) $2x - y + z - 7 = 0$ 和 $x + y + 2z - 11 = 0$; (2) $4x + 2y + 4z - 7 = 0$ 和 $3x - 4y = 0$.

解:

$$(1) \quad \mathbf{n}_1 = (2, -1, 1), \mathbf{n}_2 = (1, 1, 2)$$

$$\cos \theta_1 = |\cos \langle \mathbf{n}_1, \mathbf{n}_2 \rangle| = \frac{3}{\sqrt{6} \cdot \sqrt{6}} = \frac{1}{2}, \therefore \text{平面夹角为 } \theta_1 = \frac{\pi}{3}$$

$$(2) \quad \mathbf{n}_1 = (2, 1, 2), \mathbf{n}_2 = (3, -4, 0)$$

$$\cos \theta_2 = |\cos \langle \mathbf{n}_1, \mathbf{n}_2 \rangle| = \frac{2}{\sqrt{9} \cdot \sqrt{25}} = \frac{2}{15}, \therefore \text{平面夹角为 } \theta_2 = \arccos \frac{2}{15}$$

8. 计算点到平面的距离 d : (1) $M(2, -1, -1), 16x - 12y + 15z - 4 = 0$; (2) $M(9, 2, -2), 12y - 5z + 5 = 0$

★ 点和面间的距离

点面距离: $d_{\text{点-面}} = \frac{|Ax_0 + By_0 + Cz_0 + D|}{\sqrt{A^2 + B^2 + C^2}}$, 平行面距离: $d_{\text{平行面-面}} = \frac{|D_1 - D_2|}{\sqrt{A^2 + B^2 + C^2}}$

解:

$$d_1 = \frac{|32 + 12 - 15 - 4|}{\sqrt{16^2 + (-12)^2 + 15^2}} = \frac{25}{25} = 1$$

$$d_2 = \frac{|12 \cdot 2 - 5 \cdot (-2) + 5|}{\sqrt{12^2 + (-5)^2}} = \frac{39}{13} = 3$$

9. 求两平行平面间的距离: (1) $3x + 6y - 2z - 7 = 0$ 与 $3x + 6y - 2z + 14 = 0$; (2) $2x - y + 2z + 9 = 0$ 与 $4x - 2y + 4z - 21 = 0$.

解:

$$d_1 = \frac{21}{\sqrt{3^2 + 6^2 + 2^2}} = \frac{21}{7} = 3$$

$$d_2 = \frac{9 + \frac{21}{2}}{\sqrt{2^2 + (-1)^2 + 2^2}} = \frac{39}{6} = \frac{13}{2}$$

10. 试判定点 $M(2, -1, 1)$ 与原点在下列平面的同侧还是异侧? (1) $5x + 3y + z - 18 = 0$; (2) $x + 5y + 12z - 1 = 0$

解:

$$(5 \times 2 + 3 \times (-1) + 1 - 18) \cdot (-18) > 0, \text{在同侧}$$

$$(2 + 5 \times (-1) + 12 - 1) \cdot (-1) < 0, \text{在异侧}$$

11. 求与两平面 $x + y - 2z - 1 = 0$ 和 $x + y - 2z + 3 = 0$ 等距离的平面.

$$\text{解: } x + y - 2z + 1 = 0$$

12. 求两平面 $2x - y + z - 7 = 0$ 和 $x + y + 2z - 11 = 0$ 所成两个二面角的平分面.

解:

$$\frac{|2x - y + z - 7|}{\sqrt{2^2 + 1^2 + 1^2}} = \frac{|x + y + 2z - 11|}{\sqrt{1^2 + 1^2 + 2^2}}$$

$$\Rightarrow |2x - y + z - 7| = |x + y + 2z - 11|$$

所以两个二面角平分面为: $x - 2y - z + 4 = 0$ 或者 $x + z - 6 = 0$

13. 在平面 $x + y + z - 1 = 0$ 与三坐标平面所围成的四面体内求一点, 使它到四个面的距离相等.

解:

$$V = \frac{1}{3} S_{\text{全面积}} \cdot d = \frac{1}{6}, \quad S = \frac{3}{2} + \frac{\sqrt{3}}{2},$$

$$\Rightarrow d = \frac{3 - \sqrt{3}}{6}, \text{ 点 } \left(\frac{3 - \sqrt{3}}{6}, \frac{3 - \sqrt{3}}{6}, \frac{3 - \sqrt{3}}{6} \right)$$

14. 分别按下列各组条件求平面方程. (1) 平分两点 $A(1, 2, 3)$ 和 $B(2, -1, 4)$ 间的线段且垂直于线段 AB ; (2) 与平面 $6x + 3y + 2z + 12 = 0$ 平行, 而点 $(0, 2, -1)$ 到这两个平面的距离相等; (3) 通过 x 轴, 且点 $(5, 4, 13)$ 到这个平面的距离为 8 个单位; (4) 经过点 $M(0, 0, 1)$ 及 $N(3, 0, 0)$ 并与 Oxy 平面成 $\frac{\pi}{3}$ 角.

解: (1) $C_1 \left(\frac{3}{2}, \frac{1}{2}, \frac{7}{2} \right), \mathbf{n} = \overrightarrow{AB} = (1, -3, 1), \Pi: \left(x - \frac{3}{2} \right) - 3 \left(y - \frac{1}{2} \right) + \left(z - \frac{7}{2} \right) = 0$
 (2) $\because |6 - 2 + 12| = |6 - 2 + m|$, 取异于原平面的解 $m = -20, \Pi: 6x + 3y + 2z - 20 = 0$,
 (3) 设所求平面为 $By + Cz = 0$, 则 $\frac{|4B + 13C|}{\sqrt{B^2 + C^2}} = 8$,
 $\therefore \Pi: 35y + 12z = 0$ 或 $-3y + 4z = 0$,
 (4) 设法向量为 (A, B, C) . 由过 M, N 得 $C = 3A$, 且 $\frac{|C|}{\sqrt{A^2 + B^2 + C^2}} = \frac{1}{2}$,
 $\therefore B = \pm \sqrt{26}A, \quad \Pi: x \pm \sqrt{26}y + 3z - 3 = 0$

15. 分别求出满足下列各组条件的直线方程. (1) 过点 $(0, 2, 4)$ 而与两平面 $x + 2z = 1, y - 3z = 2$ 平行; (2) 过点 $(-1, 2, 1)$ 且平行于直线

$$\begin{cases} x + y - 2z - 1 = 0 \\ x + 2y - z + 1 = 0 \end{cases}$$

(3) 过点 $(2, -3, 4)$ 且和 z 轴垂直并相交; (4) 过点 $(-1, -4, 3)$ 并与下面两直线

$$\begin{cases} 2x - 4y + z = 1 \\ x + 3y = -5 \end{cases} \quad \begin{cases} x = 2 + 4t \\ y = -1 - t \\ z = -3 + 2t \end{cases} \quad \text{都垂直.}$$

解: (1) 方向向量 $\tau_1 = (1, 0, 2) \times (0, 1, -3) = (-2, 3, 1)$, 直线方程为 $\frac{x}{-2} = \frac{y - 2}{3} = \frac{z - 4}{1}$
 (2) 方向向量 $\tau_2 = (1, 1, -2) \times (1, 2, -1) = (3, -1, 1)$, 直线方程为 $\frac{x + 1}{3} = \frac{y - 2}{-1} = \frac{z - 1}{1}$
 (3) 直线方程为 $3x + 2y = 0, z = 4$

$$(4) \text{第一条直线参数方程: } \begin{cases} x = -5 - 3t \\ y = 0 + t, \\ z = -9 + 10t, \end{cases} \quad \tau_4 = (-3, 1, 10) \times (4, -1, 2) = (12, 46, -1)$$

$$\text{直线方程为 } \frac{x+1}{12} = \frac{y+4}{46} = -(z-3)$$

$$16. \text{ 求直线 } \begin{cases} 2x + 3y - z - 4 = 0, \\ 3x - 5y + 2z + 1 = 0 \end{cases} \text{ 的参数方程}$$

解: 方向向量 $\tau = (2, 3, -1) \times (3, -5, 2) = (1, -7, -19)$, 解方程得到特殊点 $(0, 7, 17)$

$$\text{参数方程: } \begin{cases} x = t \\ y = 7 - 7t \\ z = 17 - 19t \end{cases}$$

$$17. \text{ 求直线与平面的交点. (1) } \frac{x-1}{1} = \frac{y+1}{-2} = \frac{z}{6}, \quad 2x + 3y + z - 1 = 0;$$

$$(2) \frac{x+2}{-2} = \frac{y-1}{3} = \frac{z-3}{2}, \quad x + 2y - 2z + 6 = 0.$$

解:

$$(1) \text{ 参数方程: } \begin{cases} x = 1 + t \\ y = -1 - 2t, \\ z = 6t, \end{cases} \text{ 代入方程得到 } 2(1+t) + 3(-1-2t) + 6t - 1 = 0, \therefore t = 1$$

$$\text{交点为 } (2, -3, 6)$$

$$(2) \text{ 参数方程: } \begin{cases} x = -2 - 2t \\ y = 1 + 3t, \\ z = 3 + 2t, \end{cases} \text{ 代入方程得到 } (-2-2t) + 2(1+3t) - 2(3+2t) + 6 = 0, \text{ 恒成立}$$

$$\text{交点为整条直线, 因为直线在平面内}$$

$$18. \text{ 求下列直线的夹角. (1) } \begin{cases} 5x - 3y + 3z - 9 = 0 \\ 3x - 2y + z - 1 = 0 \end{cases} \text{ 和 } \begin{cases} 2x + 2y - z + 23 = 0 \\ 3x + 8y + z - 18 = 0 \end{cases}$$

$$(2) \begin{cases} x + 2y + z - 1 = 0, \\ x - 2y + z + 1 = 0 \end{cases} \text{ 和 } \begin{cases} x - y - z - 1 = 0 \\ x - y + 2z + 1 = 0 \end{cases}$$

解: (1) 直线的方向向量分别为

$$\tau_1 = (5, -3, 3) \times (3, -2, 1) = (3, 4, -1), \quad \tau_2 = (2, 2, -1) \times (3, 8, 1) = (10, -5, 10)$$

$$\cos \langle \tau_1, \tau_2 \rangle = 0, \quad \text{夹角 } \frac{\pi}{2}$$

(2) 直线的方向向量分别为

$$\tau_1 = (1, 2, 1) \times (1, -2, 1) = (4, 0, -4), \quad \tau_2 = (1, -1, -1) \times (1, -1, 2) = (-3, -3, 0)$$

$$|\cos \langle \tau_1, \tau_2 \rangle| = \frac{12}{4\sqrt{2} \cdot 3\sqrt{2}} = \frac{1}{2}, \quad \text{夹角 } \frac{\pi}{3}$$

19. 证明下列各组直线互相平行, 并求它们间的距离. (1) $\frac{x+2}{3} = \frac{y-1}{-2} = z$ 和 $\begin{cases} x+y-z=0, \\ x-y-5z-8=0 \end{cases}$ (2) $\frac{x+7}{3} = \frac{y-5}{-1} = \frac{z-9}{4}$ 和 $\begin{cases} 2x+2y-z-10=0 \\ x-y-z-22=0 \end{cases}$

★ 空间平行直线的距离

$$d_{\text{平行直线}} = \frac{|\boldsymbol{\tau} \times \overrightarrow{MN}|}{|\boldsymbol{\tau}|}$$

解: (1) 直线的方向向量分别为

$$\boldsymbol{\tau}_1 = (3, -2, 1), \quad \boldsymbol{\tau}_2 = (1, 1, -1) \times (1, -1, -5) = (-6, 4, -2)$$

$$|\cos\langle\boldsymbol{\tau}_1, \boldsymbol{\tau}_2\rangle| = \frac{28}{\sqrt{14} \cdot \sqrt{56}} = 1, \quad \text{所以相互平行, } d = \sqrt{5}$$

(2) 直线的方向向量分别为

$$\boldsymbol{\tau}_1 = (3, -1, 4), \quad \boldsymbol{\tau}_2 = (2, 2, -1) \times (1, -1, -1) = (-3, 1, -4)$$

$$|\cos\langle\boldsymbol{\tau}_1, \boldsymbol{\tau}_2\rangle| = \frac{26}{\sqrt{26} \cdot \sqrt{26}} = 1, \quad \text{所以相互平行, } d = 25$$

20. 证明下列各组直线垂直相交, 并求它们的交点. (1) $\begin{cases} x+2y=1, \\ 2y-z=1 \end{cases}$ 和 $\begin{cases} x-y=1 \\ x-2z=3 \end{cases}$ (2) $\begin{cases} 4x+y-3z+24=0, \\ z-5=0 \end{cases}$ 和 $\begin{cases} x+y+3=0 \\ x+2=0 \end{cases}$

★ 空间直线相交证明, 交点求法

相交证明: $(\boldsymbol{\tau}_1 \times \boldsymbol{\tau}_2) \cdot \overrightarrow{MN} = 0, (M, N \text{ 为各直线任意两点})$

交点求法: 写出参数方程, 解二元一次方程组

解: (1)

写出两条直线的参数方程, 1: $\begin{cases} x=1-2m \\ y=0+m, \\ z=-1+2m, \end{cases}$ 2: $\begin{cases} x=3+2n \\ y=2+2n, \\ z=0+n, \end{cases}$, $\overrightarrow{MN} = (2, 2, 1)$

$$(\boldsymbol{\tau}_1 \times \boldsymbol{\tau}_2) \cdot \overrightarrow{MN} = (-2, 1, 2) \times (2, 2, 1) \cdot (2, 2, 1) = 0 \text{ 则相交, } \boldsymbol{\tau}_1 \cdot \boldsymbol{\tau}_2 = 0 \text{ 则垂直}$$

$$\begin{cases} 1-2m=3+2n \\ 0+m=2+2n, \\ -1+2m=0+n, \end{cases} \quad m=0, n=-1, \text{ 交点}(1, 0, -1)$$

(2)

写出两条直线的参数方程, 1: $\begin{cases} x = -2 + m \\ y = -1 - 4m, \\ z = 5 + 0m, \end{cases}$ 2: $\begin{cases} x = -2 + 0n \\ y = -1 + 0n, \\ z = 0 + n, \end{cases} \quad \overrightarrow{MN} = (0, 0, -5)$

$$(\tau_1 \times \tau_2) \cdot \overrightarrow{MN} = (1, -4, 0) \times (0, 0, 1) \cdot (0, 0, -5) = 0 \text{ 则相交, } \tau_1 \cdot \tau_2 = 0 \text{ 则垂直}$$

$$\begin{cases} -2 + m = -2 + 0n \\ -1 - 4m = -1 + 0n, \\ 5 + 0m = 0 + n, \end{cases} \quad m = 0, n = 5, \text{ 交点 } (-2, -1, 5)$$

21. 求直线和平面的夹角 ϕ . (1) $\begin{cases} 3x - 2y = 24, \\ 3x - z = -4 \end{cases} \quad 6x + 15y - 10z + 31 = 0;$
 (2) $\begin{cases} x + y + 3z = 0, \\ x - y - z = 0 \end{cases} \quad x - y - z + 1 = 0$

解: (1) 方向向量 $\tau = (3, -2, 0) \times (3, 0, -1) = (2, 3, 6)$, 平面法向量 $n = (6, 15, -10)$

$$\sin \phi = |\cos \langle \tau, n \rangle| = \left| \frac{-3}{\sqrt{49}\sqrt{361}} \right| = \frac{3}{133}, \phi = \arcsin \frac{3}{133}$$

(2) 方向向量 $\tau = (1, 1, 3) \times (1, -1, -1) = (2, 4, -2)$, 平面法向量 $n = (1, -1, -1)$

$$\sin \phi = |\cos \langle \tau, n \rangle| = \left| \frac{0}{\sqrt{32}\sqrt{3}} \right| = 0, \phi = 0$$

22. 求点到直线的距离 d .

(1) $P_0(1, 0, -1), \frac{x}{1} = \frac{y-1}{2} = \frac{z}{-1};$ (2) $M_0(1, 2, 3), \begin{cases} x + y - z = 1 \\ 2x + z = 3 \end{cases}$

解:

(1) 直线方向向量 $\tau = (1, 2, -1)$, 连接 P_0 和直线上一点 $Q(t, 2t+1, -t)$

$$\overrightarrow{P_0Q} = (t-1, 2t+1, -t+1), \quad \tau \cdot \overrightarrow{P_0Q} = 0$$

$$\therefore t = 0, \quad |\overrightarrow{P_0Q}| = d = \sqrt{3}$$

(2) 对于直线方程 $\begin{cases} x + y - z = 1 \\ 2x + z = 3 \end{cases} \Leftrightarrow$ 改写参数形式: $\frac{x}{-1} = \frac{y-4}{3} = \frac{z-3}{2},$

直线方向向量 $\tau = (-1, 3, 2)$, 连接 M_0 和直线上一点 $N(-t, 3t+4, 2t+3)$

$$\overrightarrow{M_0N} = (-t-1, 3t+2, 2t), \quad \tau \cdot \overrightarrow{M_0N} = 0$$

$$\therefore t = -\frac{1}{2}, \quad |\overrightarrow{M_0N}| = d = \frac{\sqrt{6}}{2}$$

23. 证明下列各组直线是异面直线, 并求它们的距离 (即两直线公垂线之长). (1)

$$\frac{x-9}{4} = \frac{y+2}{-3} = \frac{z}{1} \text{ 和 } \frac{x}{-2} = \frac{y+7}{9} = \frac{z-2}{2}; (2) \begin{cases} x+y-z-1=0, \\ 2x+y-z-2=0 \end{cases} \text{ 和}$$

$$\begin{cases} x+2y-z-2=0 \\ x+2y+2z+4=0 \end{cases}$$

★ 空间异面直线的距离

$$d_{\text{异面直线}} = \frac{|(\tau_1 \times \tau_2) \cdot \overrightarrow{MN}|}{|\tau_1 \times \tau_2|}$$

解: (1)

$$\overrightarrow{MN} = (-9, -5, 2), (\tau_1 \times \tau_2) \cdot \overrightarrow{MN} = (4, -3, 1) \times (-2, 9, 2) \cdot (-9, -5, 2) = 245 \neq 0 \text{ 则异面}$$

$$d_1 = \frac{245}{|(-15, -10, 30)|} = \frac{245}{\sqrt{1225}} = 7$$

(2)

写出两条直线的点向式, 直线方程 1: $\frac{y}{1} = \frac{z}{1}, x=1$, 直线方程 2: $\frac{x}{-2} = y, z=-2$

$$\text{取 } M = (1, 0, 0), N = (0, 0, -2), \overrightarrow{MN} = (-1, 0, -2),$$

$$(\tau_1 \times \tau_2) \cdot \overrightarrow{MN} = (0, 1, 1) \times (-2, 1, 0) \cdot (-1, 0, -2) = -3 \neq 0, \text{ 故异面}$$

$$d_2 = \frac{|-3|}{|(-1, -2, 2)|} = 1$$

24. 试求通过直线 $\begin{cases} 3x+2y-z-1=0, \\ 2x-3y+2z+2=0 \end{cases}$ 并垂直于平面 $x+2y+3z-5=0$ 的平面方程.

解: 过直线的平面束方程为: $3x+2y-z-1+\lambda(2x-3y+2z+2)=0$,

法向量为: $\mathbf{n}_1 = (3+2\lambda, 2-3\lambda, 2\lambda-1)$, 该平面与另一个平面垂直

$$\mathbf{n}_1 \cdot \mathbf{n}_2 = (3+2\lambda, 2-3\lambda, 2\lambda-1) \cdot (1, 2, 3) = 0, \Rightarrow \lambda = -2$$

$$\text{故所求平面方程: } -x+8y-5z-5=0$$

25. 求通过直线 $x=3t+1, y=2t+3, z=-t-2$ 且平行于直线 $\begin{cases} 2x-y+z-3=0, \\ x+2y-z-5=0 \end{cases}$ 的平面方程.

解: 第一条直线改写成两平面交线 $\begin{cases} 2x-3y+7=0, \\ y+2z+1=0 \end{cases}$,

由此写出平面束方程 $(2x - 3y + 7) + \lambda(y + 2z + 1) = 0$

法向量为: $\mathbf{n} = (2, -3 + \lambda, 2\lambda)$, 另一直线方向向量 $\boldsymbol{\tau} = (2, -1, 1) \times (1, 2, -1) = (-1, 3, 5)$

$\therefore \boldsymbol{\tau} \cdot \mathbf{n} = 0, \Rightarrow 13\lambda = 11$, 故平面方程为: $13x - 14y + 11z + 51 = 0$

26. 过直线 $\begin{cases} 5x - 11z + 7 = 0, \\ 5y + 7z - 4 = 0 \end{cases}$ 作两互相垂直的平面. 其中一平面过点 $(4, -3, 1)$, 求此二平面方程.

解: 应用到平面束方程 (见后文), 可设过点 $(4, -3, 1)$ 的平面为

$$(2x + y - 3z + 2) + m(5x + 5y - 4z + 3) = 0,$$

将 $(4, -3, 1)$ 代入得 $m = -1$, 所以方程为 $\Pi_1: 3x + 4y - z + 1 = 0$ 设另一垂直平面为

$$(2x + y - 3z + 2) + n(5x + 5y - 4z + 3) = 0$$

则由垂直的充要条件有 $3(2 + 5n) + 4(1 + 5n) - (-3 - 4n) = 0 \Rightarrow n = -\frac{1}{3}$,
所以平面方程为 $\Pi_2: x - 2y - 5z + 3 = 0$ 和 $\Pi_1: 3x + 4y - z + 1 = 0$

27. 求点 $(-1, 2, 0)$ 在平面 $x + 2y - z + 1 = 0$ 上的投影.

解: 写出过 $(-1, 2, 0)$, 且垂直于平面 $x + 2y - z + 1 = 0$

$$\text{直线参数方程为 } \begin{cases} x = t - 1 \\ y = 2t + 2 \\ z = -t \end{cases} \Rightarrow \text{交点满足 } (t - 1) + 2(2t + 2) - (-t) + 1 = 0, \\ \therefore t = -\frac{2}{3}$$

所以投影点为 $(-\frac{5}{3}, \frac{2}{3}, \frac{2}{3})$

28. 求点 $(2, 3, 1)$ 在直线 $x = t - 7, y = 2t - 2, z = 3t - 2$ 上的投影.

解:

连接参考点和直线上参数点 $\boldsymbol{\alpha} = (t - 9, 2t - 5, 3t - 3)$, 直线方向向量为 $\boldsymbol{\tau} = (1, 2, 3)$,
点在直线上投影意味着垂直关系, $\therefore \boldsymbol{\alpha} \cdot \boldsymbol{\tau} = 0, (t - 9) + 2(2t - 5) + 3(3t - 3) = 0, t = 2$
所以说投影点为 $(-5, 2, 4)$

29. 求原点关于平面 $6x + 2y - 9z + 121 = 0$ 对称的点的坐标.

★ 空间点关于平面对称的求法

设平面 $\Pi: Ax + By + Cz + D = 0$, 法向量 $\mathbf{n} = (A, B, C)$

设初始点 $M_0(a, b, c)$, 过 M_0 且垂直平面方程参数形式

$$\Rightarrow x = At + a, \quad y = Bt + b, \quad z = Ct + c$$

代入平面方程得到 $A(At + a) + B(Bt + b) + C(Ct + c) + D = 0$

$$\text{解得参数 } t = -\frac{Aa + Bb + Cc + D}{A^2 + B^2 + C^2}$$

所以对称点 $M' = (2At + a, 2Bt + b, 2Ct + c)$

解: 本题中 $t = -\frac{121}{2^2 + 6^2 + 9^2} = -1$, $M' = (-12, -4, 18)$.

27. 求点 $(1, 2, 3)$ 关于直线 $\frac{x}{1} = \frac{y-4}{-3} = \frac{z-3}{-2}$ 对称的点的坐标.

解: 先解出投影点, 给出直线参数式 $\begin{cases} x = t \\ y = -3t + 4 \\ z = -2t + 3 \end{cases}$,

连接参考点和直线上参数点 $\alpha = (t-1, -3t+2, -2t)$, 直线方向向量为 $\tau = (1, -3, -2)$,

$$\therefore \alpha \cdot \tau = 0, \quad (t-1) - 3(-3t+2) - 2(-2t) = 0 \Rightarrow t = \frac{1}{2},$$

所以投影点为: $(\frac{1}{2}, \frac{5}{2}, 2)$, 对称点直线另一侧: $(0, 3, 4)$

28. 试求 λ , 使两直线 $\frac{x-1}{\lambda} = \frac{y+4}{5} = \frac{z-3}{-3}$ 与 $\frac{x+3}{3} = \frac{y-9}{-4} = \frac{z+14}{7}$ 相交, 并求出交点和由此两直线确定的平面方程.

解: 两直线相交, 则其上任取三点, 构成的向量混合积一定为 0,

取 $A(1, -4, 3), B(-3, 9, -14), \overrightarrow{BA} = (4, -13, 17)$, 直线方向向量 $\tau_1 = (\lambda, 5, -3), \tau_2 = (3, -4, 7)$

$$(\tau_1 \times \tau_2) \cdot \overrightarrow{AB} = 0 \Rightarrow \begin{vmatrix} \lambda & 5 & -3 \\ 3 & -4 & 7 \\ 4 & -13 & 17 \end{vmatrix} = 0, \therefore \lambda = 2, \text{ 交点 } (3, 1, 0)$$

$\therefore \mathbf{n} = \tau_1 \times \tau_2 = (23, -23, -23)$ 故平面方程为: $x - y - z - 2 = 0$

29. 一直线通过点 $(-3, 5, -9)$, 且与两直线

$$\begin{cases} y = 3x + 5, \\ z = 2x - 3 \end{cases} \quad \begin{cases} 4x - y - 7 = 0 \\ 5x - z + 10 = 0 \end{cases}$$

相交, 求其方程.

解: 设点 $A(-3, 5, -9)$, 取直线上任意一点 B , 令 $x = t$, $\therefore B(t, 3t + 5, 2t - 3)$

$\therefore l_1: \frac{x+3}{t+3} = \frac{y-5}{3t} = \frac{z+9}{2t+6} \therefore AB$ 所在的 l_1 与 l_2 相交, 将 $l_2: y = 4x - 7, z = 5x + 10$ 代入上式, 可得: $\frac{5x+19}{2t+6} = \frac{4x-12}{3t} = \frac{x+3}{t+3}$ 解得: $x = -\frac{13}{3}, t = -\frac{66}{19}$

$\therefore$ 所求直线方程为: $\frac{x+3}{-\frac{66}{19}+3} = \frac{y-5}{-\frac{66}{19} \cdot 3} = \frac{z+9}{-\frac{66}{19} \cdot 2+6}$ 可化简可得: $\frac{x+3}{1} = \frac{y-5}{22} = \frac{z+9}{2}$

30. 求直线 $\begin{cases} x + y - z - 1 = 0, \\ x - y + z + 1 = 0 \end{cases}$ 在平面 $x + y + z = 0$ 上的投影直线的方程.

★ 平面束方程

此处应用到平面束方程, 可以写出有公共相交直线的一系列平面束 (例如下图),

基本形式是: $\lambda\Pi_1 + \mu\Pi_2 = 0$, 即 $\lambda(A_1x + B_1y + C_1z + D_1) + \mu(A_2x + B_2y + C_2z + D_2) = 0$

平面束方程: $(x + y - z - 1) + \lambda(x - y + z + 1) = 0$

解: 方程: $(x + y - z - 1) + \lambda(x - y + z + 1) = 0 \Rightarrow (1 + \lambda)x + (1 - \lambda)y + (\lambda - 1)z + (\lambda - 1) = 0$

假想通过一个平面投影该直线, 该平面垂直于 $x + y + z = 0$,

由法向量垂直得到 $\therefore 1 + \lambda + 1 - \lambda + \lambda - 1 = 0 \Rightarrow \lambda = -1$, 该平面为 $2y - 2z - 2 = 0$

联立 $\begin{cases} x + y + z = 0 \\ 2y - 2z - 2 = 0 \end{cases} \Rightarrow$ 投影直线 $\frac{x + \frac{1}{3}}{-2} = \frac{y - \frac{2}{3}}{1} = \frac{z + \frac{1}{3}}{1}$

31. 写出垂直于平面 $5x - y + 3z - 2 = 0$, 且与它的交线在 Oxy 平面上的平面方程.

解: 利用过 XoY 平面信息, 写出平面束方程 $5x - y + 3z - 2 + \lambda z = 0$,

$$\therefore (5, -1, 3) \cdot (5, -1, 3 + \lambda) = 0 \Rightarrow \lambda = -\frac{35}{3}, \text{ 平面方程为: } 15x - 3y - 26z - 6 = 0$$

32. 求由原点到直线 $\frac{x-5}{4} = \frac{y-2}{3} = \frac{z+1}{-2}$ 的垂线方程.

$$\text{解: 先解出投影点, 给出直线参数式 } \begin{cases} x = 4t + 5 \\ y = 3t + 2 \\ z = -2t - 1 \end{cases},$$

连接参考点和直线上参数点 $\alpha = (4t + 5, 3t + 2, -2t - 1)$, 直线方向向量为 $\tau = (4, 3, -2)$,

$$\therefore \alpha \cdot \tau = 0, \quad 4(4t + 5) + 3(3t + 2) - 2(-2t - 1) = 0 \Rightarrow t = -\frac{28}{29},$$

$$\alpha = \left(\frac{33}{29}, -\frac{26}{29}, \frac{27}{29}\right) \quad \text{所以垂线方程为: } \frac{x}{33} = \frac{y}{-26} = \frac{z}{27}$$

8.3 习题 二次曲面

1. 指出下列方程中哪些是旋转曲面, 它们是怎样产生的. (1) $\frac{x^2}{4} + \frac{y^2}{9} + \frac{z^2}{9} = 1$ (2) $x^2 + y^2 + z^2 = 1$ (3) $x^2 + 2y^2 + 34z^2 = 1$ (4) $x^2 - \frac{y^2}{4} + z^2 = 1$; (5) $\frac{x^2}{9} + \frac{y^2}{16} - \frac{z^2}{9} = -1$ (6) $x^2 - y^2 - z^2 = 1$ (7) $x^2 + y^2 = 4z$ (8) $\frac{x^2}{4} - \frac{y^2}{9} = 3z$

解: (1) 旋转椭球面: $\frac{x^2}{4} + \frac{y^2}{9} = 1$ 绕 x 轴旋转一周; (2) 球面: $x^2 + y^2 = 1$ 绕 x 轴旋转一周; (3) 椭球面; (4) 旋转单叶双曲面: $x^2 - \frac{y^2}{4} = 1$; 绕 y 轴旋转一周; (5) 双叶双曲面; (6) 旋转双叶双曲面: $x^2 - y^2 = 1$; 绕 x 轴旋转一周; (7) 旋转抛物面: $x^2 = 4z$; 绕 z 轴旋转一周; (8) 双曲抛物面

2. 指出下列方程在平面直角坐标系 Oxy 和空间直角坐标系 $Oxyz$ 中分别表示怎样的几何图形. (1) $x = 2$ (2) $y = x + 1$; (3) $x^2 + y^2 = 4$; (4) $x^2 - y^2 = 1$; (5) $y = x^2 + 1$ (6) $\begin{cases} 5x - y + 1 = 0 \\ 2x - y - 3 = 0 \end{cases}$ (7) $\begin{cases} \frac{x^2}{4} + \frac{y^2}{9} = 1 \\ y = 2 \end{cases}$ (8) $\begin{cases} \frac{x^2}{4} - \frac{y^2}{9} = 1 \\ x = 4 \end{cases}$

解: (1) 直线; 平面 (2) 直线; 平面 (3) 圆; 圆柱 (4) 双曲线; 双曲柱面 (5) 抛物线; 抛物柱面 (6) 点; 直线 (7) 两个点; 两条线 (8) 两个点; 两条线

3. 求下列旋转曲面的方程, 并指出它们的名称. (1) 曲线 $\begin{cases} y^2 - \frac{z^2}{4} = 1 \\ x = 0 \end{cases}$ 轴旋转一周; (2) 曲线 $\begin{cases} y = \sin x (0 \leq x \leq \pi), \\ z = 0 \end{cases}$ 绕 x 轴旋转一周; (3) 曲线 $\begin{cases} 4x^2 + 9y^2 = 36 \\ z = 0 \end{cases}$ 绕 y 轴旋转一周;

解: (1) $y^2 + x^2 - \frac{z^2}{4} = 1$ 单叶双曲面 (2) $\sqrt{y^2 + z^2} = \sin x, x = \arcsin \sqrt{y^2 + z^2}$ 正弦曲面 (3) $\frac{x^2}{9} + \frac{y^2}{4} + \frac{z^2}{9} = 1$ 旋转椭球面

4. 求 Oyz 平面上的直线 $y - 2z + 1 = 0$ 绕 Oyz 平面上的直线 $y = z$ 旋转所得旋转曲面的方程.

方法:在母线(旋转曲线)和旋转轴上各取一点,利用母线和旋转轴垂面得出交线。

解: $z = y$ 为旋转轴, 取转轴一点 $(0, 0, 0)$,

取直线上一点的参数形式 $M(0, 2t - 1, t)$, 曲面上假设一点 $N(x, y, z)$

$$\begin{cases} y - (2t - 1) + (z - t) = 0 & (\text{过 } MN \text{ 与 } O \text{ 点垂直平面}) \\ x^2 + y^2 + z^2 = 0^2 + (2t - 1)^2 + t^2 & (|MO| = |NO|) \end{cases}$$

$$\text{由 (1) 式 } t = \frac{1}{3}(y + z + 1), \text{ 代入得到 } \Rightarrow x^2 + \frac{4}{9}(y^2 + z^2) + \frac{2}{9}(y + z) - \frac{2}{9} - \frac{10}{9}yz = 0$$

5. 求直线 $L: \frac{x-1}{1} = \frac{y}{1} = \frac{z-1}{-1}$ 在平面 $\Pi: x - y + 2z - 1 = 0$ 上的投影直线 L_0 的方程, 并求 L_0 绕 y 轴旋转一周所成曲面的方程

解:(方法一) 设经过 L 且垂直于平面 Π 的平面方程为 $\Pi_1: A(x-1) + By + C(z-1) = 0$ 则由条件可知 $A - B + 2C = 0, A + B - C = 0$,

由此解得 $A : B : C = -1 : 3 : 2$, 于是 Π_1 的方程为 $x - 3y - 2z + 1 = 0$. 从而 L_0 的方程为 $L_0: \begin{cases} x - y + 2z - 1 = 0, \\ x - 3y - 2z + 1 = 0, \end{cases}$ 即 $\begin{cases} x = 2y \\ z = -\frac{1}{2}(y - 1). \end{cases}$ 于是 L_0 绕 y 轴旋转一周所成曲面的方程为 $x^2 + z^2 = 4y^2 + \frac{1}{4}(y - 1)^2$ 即 $4x^2 - 17y^2 + 4z^2 + 2y - 1 = 0$.

(方法二) L 的参数方程为: $x = 1 + t, y = t, z = 1 - t$, 代入平面 Π 的方程得交点 $(2, 1, 0)$. 又 $(1, 0, 1)$ 在直线 L 上, 过此点作垂直于平面的直线, 方向向量为 $(1, -1, 2)$, 直线方程为

$$x = 1 + t, \quad y = -t, \quad z = 1 + 2t$$

代入平面 Π 的方程解得交点 $(\frac{2}{3}, \frac{1}{3}, \frac{1}{3})$. 连接 $(2, 1, 0), (\frac{2}{3}, \frac{1}{3}, \frac{1}{3})$ 得投影直线 L_0 的方程为

$$\frac{x-2}{2-\frac{2}{3}} = \frac{y-1}{1-\frac{1}{3}} = \frac{z-0}{0-\frac{1}{3}} \Leftrightarrow \frac{x-2}{4} = \frac{y-1}{2} = \frac{z}{-1}$$

最后, 设所求旋转曲面上点 (x, y, z) 是由 L_0 上点 (x_0, y_0, z_0) 绕 y 轴旋转而得, 则有

$$\begin{aligned} \frac{x_0 - 2}{4} = \frac{y_0 - 1}{2} = \frac{z_0}{-1}, \quad y_0 = y, \quad x^2 + z^2 = x_0^2 + z_0^2 \\ \Leftrightarrow 4x^2 - 17y^2 + 2y + 4z^2 = 1 \end{aligned}$$

6. 画出下列各组曲面所围成的立体图形. (1) $\frac{x}{3} + \frac{y}{2} + z = 1, x = 0, y = 0, z = 0$ (2) $z = x^2 + y^2, x = 0, y = 0, z = 0, x + y - 1 = 0$ (3) $z = \sqrt{x^2 + y^2}, x^2 + y^2 + z^2 = R^2$ (4) $x^2 + y^2 = 2x, z = 0, z = 1$; (5) $x^2 + y^2 + z^2 = R^2, x^2 + y^2 + (z - R)^2 = R^2$.

图 1. $\frac{x}{3} + \frac{y}{2} + z = 1, x = 0, y = 0, z = 0$

图 2. $z = x^2 + y^2, x = 0, y = 0, z = 0, x + y - 1 = 0$

图 3. $z = \sqrt{x^2 + y^2}, x^2 + y^2 + z^2 = R^2$

图 4. $x^2 + y^2 = 2x, z = 0, z = 1$

图 5. $x^2 + y^2 + z^2 = R^2, x^2 + y^2 + (z - R)^2 = R^2$

7. 考察曲面 $x^2 - y^2 - z^2 = 9$ 在下列平面上的截痕. (1) $z = 0$ (2) $x = 0$; (3) $y = 0$; (4) $x = 5$.

解: (1) $x^2 - y^2 = 9$ (2) $y^2 + z^2 + 9 = 0$ (3) $x^2 - z^2 = 9$ (4) $y^2 + z^2 = 16$

8. 一动点 $P(x, y, z)$ 到原点的距离等于它到平面 $z = 4$ 的距离, 谈求此动点 P 的轨迹, 并判定它是什么曲面.

解:

$$\sqrt{x^2 + y^2 + z^2} = |z - 4|, \therefore x^2 + y^2 + z^2 = z^2 - 8z + 16$$

$$\frac{x^2 + y^2}{8} = -(z - 2) \text{ 是一个旋转抛物面.}$$

9. 建立通过两曲面 $x^2 + y^2 + 4z^2 = 1$ 和 $x^2 = y^2 + z^2$ 的交线, 而母线平行于 z 轴的柱面方程.

解: 由于新柱面母线平行于 z 轴, 故两个方程消去 z 得到 $5x^2 - 3y^2 = 1$, 这是一个双曲柱面

10. 已知一球面经过点 $(0, -3, 1)$ 且与 Oxy 平面交成圆周 $\begin{cases} x^2 + y^2 = 16 \\ z = 0 \end{cases}$, 试求其方程.

解: 球心设为 $(0, 0, a)$, 球半径设为 R , $r = 4$

$$\begin{cases} R^2 = r^2 + a^2 \Rightarrow a^2 + 16 = R^2 \\ (0 - 0)^2 + (3 - 0)^2 + (1 - a)^2 = R^2 \Rightarrow R^2 = (a - 1)^2 + 9 \end{cases}$$

$$\therefore a = -3, \quad x^2 + y^2 + (z + 3)^2 = 25$$

11. 建立单叶双曲面 $\frac{x^2}{16} + \frac{y^2}{4} - \frac{z^2}{5} = 1$ 与平面 $x - 2z + 3 = 0$ 的交线在 xOy 平面上的投影的曲线方程.

解:

$$\begin{aligned} \text{由 } x - 2z + 3 = 0, \quad \text{将 } z = \frac{x+3}{2} \text{ 代入 } \frac{x^2}{16} + \frac{y^2}{4} - \frac{z^2}{5} = 1 \\ \Rightarrow \text{投影方程 } x^2 + 20y^2 - 24x - 116 = 0 \end{aligned}$$

12. 问在 xy 平面中方程 $xy = h$ (h 是或正, 或负, 或为零的常数) 表示怎样的曲线? 在空间坐标系中方程 $xy = z$ 表示什么曲面? 试用截面法研究它的图形.(双曲抛物面/马鞍面)

8.4 习题 坐标变换和其他坐标系

1. 通过坐标系的平移, 化简方程 $x^2 - y^2 - z^2 - 2x + 2y + z - 1 = 0$, 并指出曲面的类型.

$$\begin{aligned}\text{解: } (x-1)^2 - (y-1)^2 - (z-\frac{1}{2})^2 + \frac{1}{4} - 1 &= 0 \\ x' = x-1, y' = y-1, z' = z-\frac{1}{2} \\ \therefore x'^2 - y'^2 - z'^2 &= \frac{3}{4}, \text{ 这是一个双叶双曲面}\end{aligned}$$

2. 通过坐标变换, 化简方程 $xy - x + y + z + 1 = 0$, 并指出曲面的类型.

解: 先通过坐标系的旋转, 消去方程中的 xy 项, 可将坐标系 $Oxyz$ 绕 z 轴沿逆时针方向旋转 $\frac{\pi}{4}$ 得到新坐标系 $Ox'y'z'$, 于是有坐标变换 $x = \frac{x' - y'}{\sqrt{2}}, y = \frac{x' + y'}{\sqrt{2}}, z = z'$

$$\begin{aligned}\text{代回原方程得到, } \frac{x'^2 - y'^2}{2} - \frac{x' - y'}{\sqrt{2}} + \frac{x' + y'}{\sqrt{2}} + z' + 1 &= 0 \\ \Rightarrow x'^2 - y'^2 + 2\sqrt{2}y' + 2z' + 2 &= 0, \text{ 这是一个双曲抛物面}\end{aligned}$$

3. 通过坐标旋转, 化简方程 $5x^2 - 3y^2 + 3z^2 + 8yz - 5 = 0$, 并指出它是什么曲面.

解: 二次型在 y, z 方向上的矩阵为 $\begin{pmatrix} -3 & 4 \\ 4 & 3 \end{pmatrix}$, 其特征值为 $5, -5$. 取正交变换

$$x = x', \quad y = \frac{1}{\sqrt{5}}y' - \frac{2}{\sqrt{5}}z', \quad z = \frac{2}{\sqrt{5}}y' + \frac{1}{\sqrt{5}}z',$$

则 $-3y^2 + 3z^2 + 8yz = 5y'^2 - 5z'^2$, 原方程化为

$$5x'^2 + 5y'^2 - 5z'^2 - 5 = 0,$$

即 $x'^2 + y'^2 - z'^2 = 1$, 这是一个单叶双曲面。

4. 将下列方程按要求做相应的变换: (1) $x^2 - y^2 = 25$ 转换成柱面坐标系方程和球面坐标系方程; (2) $x^2 + y^2 + 4z^2 = 10$ 转换成柱面坐标系方程和球面坐标系方程; (3) $2x^2 + 2y^2 - 4z^2 = 0$ 转换成球面坐标系方程; (4) $x^2 - y^2 - z^2 = 1$ 转换成球面坐标系方程; (5) $r^2 + 2z^2 = 4$ 转换成球面坐标系方程; (6) $\rho = 2\cos\phi$ 转换成柱面坐标系方程; (7) $x + y = 4$ 转换成柱面坐标系方程; (8) $x + y + z = 1$ 转换成球面坐标系方程; (9) $r = 2\sin\theta$ 转换成直角坐标系方程; (10) $r^2\cos 2\theta = z$ 转换成直角坐标系方程; (11) $\rho\sin\phi = 1$ 转换成直角坐标系方程.

$$\begin{aligned}\text{解: (1) } r^2\cos 2\theta &= 25 \quad ; \quad \rho^2\sin^2\phi\cos 2\theta = 25 \\ (2) \quad r^2 + 4z^2 &= 10 \quad ; \quad \rho^2(1 + 3\cos^2\phi) = 10\end{aligned}$$

- (3) $\rho^2(\sin^2 \phi - 2 \cos^2 \phi) = 0$
- (4) $\rho^2(\sin^2 \phi \cos 2\theta - \cos^2 \phi) = 1$
- (5) $\rho^2(1 + \cos^2 \phi) = 4$
- (6) $r^2 + z^2 = 2z$
- (7) $r(\cos \theta + \sin \theta) = 4$
- (8) $\rho(\sin \phi \cos \theta + \sin \phi \sin \theta + \cos \phi) = 1$
- (9) $x^2 + y^2 = 2y$
- (10) $x^2 - y^2 = z$
- (11) $x^2 + y^2 = 1$

5. 将 Ozx 平面上抛物线 $z = 2x^2$ 绕 z 轴旋转一周, 写出所生成的曲面在柱面坐标系中的方程.

解: $z = 2x^2 + 2y^2 \Rightarrow$ 柱坐标系下: $z = 2r^2$

6. 将 Ozx 平面上双曲线 $2x^2 - z^2 = 2$ 绕 z 轴旋转一周, 写出所生成的曲面在柱面坐标系中的方程.

解: $z^2 = 2x^2 + 2y^2 - 2 \Rightarrow$ 柱坐标系下: $z^2 = 2r^2 - 2$

7. 已知 Oxy 平面上以原点为圆心, a 为半径的圆的参数方程表示为

$$\begin{cases} x = a \cos t \\ y = a \sin t \end{cases} \quad t \in [0, 2\pi)$$

求 Oxy 平面上以点 $P_0(x_0, y_0)$ 为圆心, a 为半径的圆的一个参数方程表示.

$$\text{解: } \begin{cases} x = x_0 + a \cos t \\ y = y_0 + a \sin t \end{cases} \quad t \in [0, 2\pi)$$

8. 已知 $Oxyz$ 空间中以原点为圆心, a 为半径的球的参数方程表示为

$$\begin{cases} x = a \sin u \cos v \\ y = a \sin u \sin v, \quad u \in [0, \pi], v \in [0, 2\pi) \\ z = a \cos u \end{cases}$$

求 $Oxyz$ 空间中以点 $P_0(x_0, y_0, z_0)$ 为圆心, a 为半径的球的一个参数方程表示.

$$\text{解: } \begin{cases} x = x_0 + a \sin u \cos v \\ y = y_0 + a \sin u \sin v, \quad u \in [0, \pi], v \in [0, 2\pi) \\ z = z_0 + a \cos u \end{cases}$$

9. 求椭球面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ 的一个参数方程表示.

$$\text{解: } \begin{cases} x = a \sin \theta \cos \varphi \\ y = b \sin \theta \sin \varphi, \quad \theta \in [0, \pi], \varphi \in [0, 2\pi) \\ z = c \cos \theta \end{cases}$$

10. 利用双曲函数, 给出双曲线 $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ 的一个参数方程表示.

解:

$$\begin{cases} x = \pm a \cosh t \\ y = b \sinh t, \quad t \in (-\infty, +\infty) \end{cases}$$

11. 分别求单叶双曲面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ 和双叶双曲面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$ 的一个参数方程表示.

解: 单叶双曲面参数方程表示:

$$\begin{cases} x = a \sec \theta \cos \varphi \\ y = b \sec \theta \sin \varphi, \\ z = c \tan \theta \end{cases} \quad \begin{cases} x = a\sqrt{1+u^2} \cos v \\ y = b\sqrt{1+u^2} \sin v, \\ z = cu, \quad u \in \mathbb{R}, v \in [0, 2\pi) \end{cases} \quad \begin{cases} x = a(\cos u \mp v \sin u) \\ y = b(\sin u \pm v \cos u), \\ z = \pm cv \end{cases} \quad \begin{cases} x = a \cosh v \cos u \\ y = b \cosh v \sin u, \\ z = c \sinh v \end{cases}$$

双叶双曲面参数方程表示:

$$\begin{cases} x = a \tan \theta \cos \varphi \\ y = b \tan \theta \sin \varphi, \\ z = c \sec \theta \end{cases} \quad \begin{cases} x = a\sqrt{u^2-1} \cos v \\ y = b\sqrt{u^2-1} \sin v, \\ z = cu, \quad |u| \geq 1, v \in [0, 2\pi) \end{cases} \quad \begin{cases} x = a \sinh v \cos u \\ y = b \sinh v \sin u, \\ z = \pm c \cosh v \end{cases}$$

8.5

第 8 章综合习题

1. 设 O 为一定点, A, B, C 为不共线的三点. 证明: 点 M 位于平面 ABC 上的充分必要条件是存在实数 k_1, k_2, k_3 使得

$$\overrightarrow{OM} = k_1 \overrightarrow{OA} + k_2 \overrightarrow{OB} + k_3 \overrightarrow{OC}, \text{ 且 } k_1 + k_2 + k_3 = 1$$

证明: (必要性 $\Rightarrow$)

$\because M$ 位于 ABC 平面上, $\therefore$ 存在不全为 0 三个实数 c_1, c_2, c_3 使得 $c_1 \overrightarrow{AB} + c_2 \overrightarrow{AC} + c_3 \overrightarrow{AM} = \vec{0}$, 可断定 $c_3 \neq 0$ (若 $c_3 = 0$, 则 $c_1 \overrightarrow{AB} + c_2 \overrightarrow{AC} = \vec{0}$, 与 A, B, C 不共线矛盾)

$$\begin{aligned} c_1(\overrightarrow{OB} - \overrightarrow{OA}) + c_2(\overrightarrow{OC} - \overrightarrow{OA}) + c_3(\overrightarrow{OM} - \overrightarrow{OA}) &= \vec{0} \\ \therefore \overrightarrow{OM} &= \frac{1}{c_3} [(c_1 + c_2 + c_3) \overrightarrow{OA} - c_1 \overrightarrow{OB} - c_2 \overrightarrow{OC}] \\ &\triangleq k_1 \overrightarrow{OA} + k_2 \overrightarrow{OB} + k_3 \overrightarrow{OC} \Rightarrow k_1 + k_2 + k_3 = 1 \end{aligned}$$

(充分性 $\Leftarrow$)

$$\begin{aligned} \text{已知 } \overrightarrow{OM} &= k_1 \overrightarrow{OA} + k_2 \overrightarrow{OB} + k_3 \overrightarrow{OC}, \text{ 且 } k_1 + k_2 + k_3 = 1 \\ \overrightarrow{OM} &= k_1 \overrightarrow{OA} + k_2 \overrightarrow{OB} + k_3 \overrightarrow{OC} \\ &= k_1(\overrightarrow{OM} - \overrightarrow{AM}) + k_2(\overrightarrow{OM} - \overrightarrow{BM}) + k_3(\overrightarrow{OM} - \overrightarrow{CM}) \\ &= (k_1 + k_2 + k_3) \overrightarrow{OM} - (k_1 \overrightarrow{AM} + k_2 \overrightarrow{BM} + k_3 \overrightarrow{CM}) \\ \therefore k_1 \overrightarrow{AM} + k_2 \overrightarrow{BM} + k_3 \overrightarrow{CM} &= \vec{0} \text{ 且 } k_1, k_2, k_3 \text{ 不全为 } 0 \\ \text{故 } \overrightarrow{AM}, \overrightarrow{CM}, \overrightarrow{BM} &\text{ 三向量共面, } A, B, C, M \text{ 四点共面} \end{aligned}$$

□

2. 证明: 向量 $a - b + c, -2a + 3b - 2c, 2a - b + 2c$ 线性相关.

证明: 记 $\alpha = a - b + c, \beta = -2a + 3b - 2c, \gamma = 2a - b + 2c$, 则恒有

$$4\alpha + \beta - \gamma = 4(a - b + c) + (-2a + 3b - 2c) - (2a - b + 2c) = \vec{0}.$$

由于系数 4, 1, -1 不全为零, 故 α, β, γ 线性相关.

□

3. 证明: 三维空间中四个或四个以上的向量一定线性相关.

(一般地, 1° 凡向量个数大于向量维数; 2° 含 $\vec{0}$ 向量的向量组; 3° 部分向量组线性相关, 以上三种情况必然线性相关)

证明: (方法一) 如果前三个向量线性无关, 则它们构成三维空间的一组基, 第四个向量必可由前三个向量线性表示; 如果前三个向量线性相关, 则整个向量组当然线性相关. 故三维空间中四个或四个以上的向量一定线性相关.

(方法二)

令 $\vec{\alpha}_i = (a_i, b_i, c_i), i = 1, 2, 3, 4$ 为 $\mathbb{R}^3$ 中四个任意向量

$$\exists \lambda_1, \lambda_2, \lambda_3, \lambda_4, \text{ s.t. } \lambda_1 \vec{\alpha}_1 + \lambda_2 \vec{\alpha}_2 + \lambda_3 \vec{\alpha}_3 + \lambda_4 \vec{\alpha}_4 = \vec{0}$$

要证 $\lambda_1, \lambda_2, \lambda_3, \lambda_4$ 不全为 0

$$\Rightarrow \text{齐次线性方程组: } \begin{cases} \lambda_1 a_1 + \lambda_2 a_2 + \lambda_3 a_3 + \lambda_4 a_4 = 0 \\ \lambda_1 b_1 + \lambda_2 b_2 + \lambda_3 b_3 + \lambda_4 b_4 = 0 \\ \lambda_1 c_1 + \lambda_2 c_2 + \lambda_3 c_3 + \lambda_4 c_4 = 0 \end{cases}$$

 $\therefore$ 方程变量个数 (4 个) > 方程个数 (3 个), 方程组必有非零解故 $\lambda_1, \lambda_2, \lambda_3, \lambda_4$ 不全为 0 $\Leftrightarrow \mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3, \mathbf{a}_4$ 必然线性相关

□

4. 设 $\mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3$ 为一组基, (1) 证明: $\mathbf{a} = \mathbf{e}_1 + 2\mathbf{e}_2 - \mathbf{e}_3, \mathbf{b} = 2\mathbf{e}_1 + \mathbf{e}_2 + \mathbf{e}_3, \mathbf{c} = 3\mathbf{e}_1 + 2\mathbf{e}_3$ 为一组基; (2) 设 $\tilde{\mathbf{c}} = 3\mathbf{e}_1 + x\mathbf{e}_2 + 2\mathbf{e}_3$, 问当 x 取何值时, $\mathbf{a}, \mathbf{b}, \tilde{\mathbf{c}}$ 共面?

证明: (1) 要证明这三个向量为一组基, 只要证三者线性无关,

即 $c_1 \mathbf{a} + c_2 \mathbf{b} + c_3 \mathbf{c} = \vec{0}$ 时, 有 $c_1 = c_2 = c_3 = 0$.

$$\begin{aligned} \therefore c_1 (\mathbf{e}_1 + 2\mathbf{e}_2 - \mathbf{e}_3) + c_2 (2\mathbf{e}_1 + \mathbf{e}_2 + \mathbf{e}_3) + c_3 (3\mathbf{e}_1 + 2\mathbf{e}_3) &= \mathbf{0} \\ \Rightarrow \begin{cases} c_1 + 2c_2 + 3c_3 = 0 \\ 2c_1 + c_2 + 0c_3 = 0 \\ -c_1 + c_2 + 2c_3 = 0 \end{cases} \text{ , 由 Cramer 法则得: } D = \begin{vmatrix} 1 & 2 & 3 \\ 2 & 1 & 0 \\ -1 & 1 & 2 \end{vmatrix} &\neq 0 \\ \therefore c_1 = \frac{D_1}{D} = 0, c_2 = c_3 = 0, \therefore \mathbf{a}, \mathbf{b}, \mathbf{c} \text{ 线性无关, 是一组基} \end{aligned}$$

□

(2) $\exists \lambda_1, \lambda_2, \lambda_3$ 不全为零, 使得 $\lambda_1 \vec{a} + \lambda_2 \vec{b} + \lambda_3 \vec{c} = \mathbf{0}$

$$\Rightarrow \begin{cases} \lambda_1 + 2\lambda_2 + 3\lambda_3 = 0 \\ 2\lambda_1 + \lambda_2 + x\lambda_3 = 0 \\ -\lambda_1 + \lambda_2 + 2\lambda_3 = 0 \end{cases} \text{ , } D = \begin{vmatrix} 1 & 2 & 3 \\ 2 & 1 & x \\ -1 & 1 & 2 \end{vmatrix} = 0$$

$$\therefore D = 0 \text{ 时, } x = 1, \quad \mathbf{a}, \mathbf{b}, \tilde{\mathbf{c}} \text{ 共面}$$

5. 设向量 $\mathbf{a}, \mathbf{b}$ 的夹角为 60° , 且 $|\mathbf{a}| = 1, |\mathbf{b}| = 2$. 试求 $|\mathbf{a} \times \mathbf{b}|^2$ 和 $|(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})|$.

$$\text{解: } |\mathbf{a} \times \mathbf{b}|^2 = (|\mathbf{a}||\mathbf{b}|\sin\theta)^2 = 3$$

$$|(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})| = |-\mathbf{a} \times \mathbf{b} + \mathbf{b} \times \mathbf{a}| = |-2(\mathbf{a} \times \mathbf{b})| = 2\sqrt{3}$$

6. 证明不等式 $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} + (\mathbf{b} \times \mathbf{c}) \times \mathbf{a} + (\mathbf{c} \times \mathbf{a}) \times \mathbf{b} = \mathbf{0}$.

证明: $(\mathbf{a} \times \mathbf{b}) \times \mathbf{c} + (\mathbf{b} \times \mathbf{c}) \times \mathbf{a} + (\mathbf{c} \times \mathbf{a}) \times \mathbf{b}$

$$= (\mathbf{a} \cdot \mathbf{c})\mathbf{b} - (\mathbf{b} \cdot \mathbf{c})\mathbf{a} + (\mathbf{b} \cdot \mathbf{a})\mathbf{c} - (\mathbf{c} \cdot \mathbf{a})\mathbf{b} + (\mathbf{c} \cdot \mathbf{b})\mathbf{a} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c} = \mathbf{0}.$$

□

7. 求准线为 $\begin{cases} y^2 + z^2 = 1, \\ x = 1, \end{cases}$ 母线方向为 $\vec{s} = (2, 1, 1)$ 的柱面的一般方程.

解: 设准线上一点 $M(1, \cos \alpha, \sin \alpha)$, 柱面上一点 $N(x, y, z)$, $\overrightarrow{MN} // \vec{s}$
 $\therefore \frac{x-1}{2} = \frac{y-\cos \alpha}{1} = \frac{z-\sin \alpha}{1}$
 $\begin{cases} \cos \alpha = y - \frac{x-1}{2} \\ \sin \alpha = z - \frac{x-1}{2} \end{cases} \Rightarrow \left(y - \frac{x-1}{2}\right)^2 + \left(z - \frac{x-1}{2}\right)^2 = 1$
 一般方程: $(2y - x + 1)^2 + (2z - x + 1)^2 = 4$

8. 求准线为 $\begin{cases} y^2 + z^2 = 1, \\ x = 1. \end{cases}$ 顶点坐标为 $(2, 1, 1)$ 的锥面的一般方程.

解: 取锥面上任一点 $M(x', y', z')$ 做此点与 $(2, 1, 1)$ 的直线

$$\text{得到 } L: \frac{x-2}{x'-2} = \frac{y-1}{y'-1} = \frac{z-1}{z'-1},$$

当直线为切线时, 令 $x = 1$, $y = \frac{1-y'}{x'-2} + 1$, $z = \frac{1-z'}{x'-2} + 1$

$$\text{又由 } y^2 + z^2 = 1$$

$$\Rightarrow \text{一般方程为: } (x - y - 1)^2 + (x - z - 1)^2 = (x - 2)^2$$

9. 求直线 $x - 1 = y = z$ 绕 $x = y = 1$ 旋转所得旋转面的参数方程和一般方程.

解:

$$L_2 \text{ 方向向量: } \vec{s}_2 = (1, 0, 0) \times (0, 1, 0) = (0, 0, 1) = \vec{k}$$

$$\text{由直线 } L_1: x - 1 = y = z = t \Rightarrow L_1 \text{ 上一点 } Q(1+t, t, t)$$

旋转曲面上的动点 $P(x, y, z)$ 是由 L_1 上的 Q 旋转而来, 且取直线 L_1 上的定点 $M_0(1, 1, 0)$

$$\therefore \begin{cases} |\overrightarrow{M_0P}| = |\overrightarrow{M_0Q}| \\ |\overrightarrow{PQ}| \perp \vec{s}_2 \end{cases} \Rightarrow \begin{cases} (x-1)^2 + (y-1)^2 + z^2 = t^2 + (t-1)^2 + t^2 \\ (1+t-x, t-y, t-z) \cdot (0, 0, 1) = 0 \end{cases}$$

$$(x-1)^2 + (y-1)^2 - 2\left(z - \frac{1}{2}\right)^2 = \frac{1}{2}$$

第二式解出 $z = t$ 代入第一式得到 $(x-1)^2 + (y-1)^2 = (z-1)^2 + z^2$

$$\text{于是旋转面的一般方程: } (x-1)^2 + (y-1)^2 - 2\left(z - \frac{1}{2}\right)^2 = \frac{1}{2}$$

$$\Rightarrow 2(y-1)^2 + 2(x-1)^2 - 4\left(z - \frac{1}{2}\right)^2 = 1$$

$$\text{令 } \begin{cases} 2(x-1)^2 + 2(y-1)^2 = \sec^2 t \\ 4\left(z - \frac{1}{2}\right)^2 = \tan^2 t \end{cases}$$

$$\text{故旋转面的一个参数方程为: } \begin{cases} x = 1 + \frac{\sqrt{2}}{2} \sec t \cos u \\ y = 1 + \frac{\sqrt{2}}{2} \sec t \sin u \\ z = \frac{1}{2} + \frac{\tan t}{2}, \quad t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right), u \in [0, 2\pi) \end{cases}$$

10. 求圆 $\begin{cases} (x-2)^2 + y^2 = 1, \\ z = 0 \end{cases}$ 绕 y 轴旋转所得旋转面的参数方程和一般方程.

解: 旋转曲面可以写作 $(\sqrt{x^2 + z^2} - 2)^2 + y^2 = 1$,

等价的一般方程为 $(x^2 + y^2 + z^2 + 3)^2 = 16(x^2 + z^2)$.

其参数表示为:

$$\Rightarrow \begin{cases} x = (2 - \cos t) \cos s \\ z = (2 - \cos t) \sin s \\ y = \sin t + 0 \cdot s \end{cases}, \quad t \in [0, 2\pi], s \in [0, 2\pi]$$

11. 将坐标系 $[O; \mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3]$ 绕 $\mathbf{e}_1$ 逆时针旋转角度 α 后得到新坐标系 $[O, \tilde{\mathbf{e}}_1, \tilde{\mathbf{e}}_2, \tilde{\mathbf{e}}_3]$, 再将坐标系 $[O, \tilde{\mathbf{e}}_1, \tilde{\mathbf{e}}_2, \tilde{\mathbf{e}}_3]$ 绕 $\tilde{\mathbf{e}}_2$ 逆时针旋转角度 β 后得到的新坐标系为 $[O, \hat{\mathbf{e}}_1, \hat{\mathbf{e}}_2, \hat{\mathbf{e}}_3]$. 求 $[O, \mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3]$ 与 $[O, \hat{\mathbf{e}}_1, \hat{\mathbf{e}}_2, \hat{\mathbf{e}}_3]$ 之间的坐标变换公式.

解: 写出坐标变换表格

	$\mathbf{e}_1$	$\mathbf{e}_2$	$\mathbf{e}_3$		$\tilde{\mathbf{e}}_1$	$\tilde{\mathbf{e}}_2$	$\tilde{\mathbf{e}}_3$
$\tilde{\mathbf{e}}_1$	0	$\frac{\pi}{2}$	$\frac{\pi}{2}$	$\hat{\mathbf{e}}_1$	β	$\frac{\pi}{2}$	$\frac{\pi}{2} + \beta$
$\tilde{\mathbf{e}}_2$	$\frac{\pi}{2}$	α	$\frac{\pi}{2} - \alpha$	$\hat{\mathbf{e}}_2$	$\frac{\pi}{2}$	0	$\frac{\pi}{2}$
$\tilde{\mathbf{e}}_3$	$\frac{\pi}{2}$	$\frac{\pi}{2} + \alpha$	α	$\hat{\mathbf{e}}_3$	$\frac{\pi}{2} - \beta$	$\frac{\pi}{2}$	β

由此可以得到:

$$\begin{cases} \tilde{x} = x \\ \tilde{y} = y \cos \alpha + z \sin \alpha \\ \tilde{z} = -y \sin \alpha + z \cos \alpha \end{cases}, \begin{cases} \hat{x} = \tilde{x} \cos \beta - \tilde{z} \sin \beta \\ \hat{y} = \tilde{y} \\ \hat{z} = \tilde{x} \sin \beta + \tilde{z} \cos \beta \end{cases}$$

$[O, \mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3]$ 与 $[O, \hat{\mathbf{e}}_1, \hat{\mathbf{e}}_2, \hat{\mathbf{e}}_3]$ 之间的坐标变换公式为:

$$\Rightarrow \begin{cases} \hat{x} = x \cos \beta - (-y \sin \alpha + z \cos \alpha) \sin \beta & = x \cos \beta + y \sin \alpha \sin \beta - z \cos \alpha \sin \beta \\ \hat{y} = y \cos \alpha + z \sin \alpha & = y \cos \alpha + z \sin \alpha \\ \hat{z} = x \sin \beta + (-y \sin \alpha + z \cos \alpha) \cos \beta & = x \sin \beta - y \sin \alpha \cos \beta + z \cos \alpha \cos \beta \end{cases}$$

12. 已知椭球面的三个半轴长分别为 a, b, c , 三条对称轴方程分别为

$$3 - x = \frac{y}{2} = \frac{z}{2}, \quad \frac{x}{2} = 3 - y = \frac{z}{2}, \quad \frac{x}{2} = \frac{y}{2} = 3 - z$$

求椭球面的一般方程.

解: 三条对称轴相交于 $O'(2, 2, 2)$, 其方向向量依次为 $(-1, 2, 2), (2, -1, 2), (2, 2, -1)$; 三者两两正交且长度均为 3. 因此点 (x, y, z) 沿三条单位轴向的坐标依次为

$$\frac{-x + 2y + 2z - 6}{3}, \quad \frac{2x - y + 2z - 6}{3}, \quad \frac{2x + 2y - z - 6}{3}.$$

椭球面的一般方程为

$$\frac{(-x + 2y + 2z - 6)^2}{9a^2} + \frac{(2x - y + 2z - 6)^2}{9b^2} + \frac{(2x + 2y - z - 6)^2}{9c^2} = 1$$

13. 设在球面坐标系中有两点 (r_1, θ_1, ϕ_1) 和 (r_2, θ_2, ϕ_2) , d 是这两点之间的直线距离. 证明:

$$d = \sqrt{(r_1 - r_2)^2 + 2r_1r_2[1 - \cos(\phi_1 - \phi_2)\sin\theta_1\sin\theta_2 - \cos\theta_1\cos\theta_2]}$$

证明: 写出这两点的直角坐标, 然后运用距离公式:

$$M_1(r_1, \theta_1, \phi_1) \rightarrow M_1(x_1, y_1, z_1), \quad M_2(r_2, \theta_2, \phi_2) \rightarrow M_2(x_2, y_2, z_2)$$

$$M_1(r_1 \sin \theta_1 \cos \phi_1, r_1 \sin \theta_1 \sin \phi_1, r_1 \cos \theta_1), \quad M_2(r_2 \sin \theta_2 \cos \phi_2, r_2 \sin \theta_2 \sin \phi_2, r_2 \cos \theta_2)$$

$$\begin{aligned} d^2 &= (r_1 \sin \theta_1 \cos \phi_1 - r_2 \sin \theta_2 \cos \phi_2)^2 + (r_1 \sin \theta_1 \sin \phi_1 - r_2 \sin \theta_2 \sin \phi_2)^2 + (r_1 \cos \theta_1 - r_2 \cos \theta_2)^2 \\ &= r_1^2 \sin^2 \theta_1 + r_2^2 \sin^2 \theta_2 - 2r_1r_2 \sin \theta_1 \sin \theta_2 \cos(\phi_1 - \phi_2) + r_1^2 \cos^2 \theta_1 + r_2^2 \cos^2 \theta_2 - 2r_1r_2 \cos \theta_1 \cos \theta_2 \end{aligned}$$

$$d = \sqrt{r_1^2 + r_2^2 - 2r_1r_2(\sin \theta_1 \sin \theta_2 (\cos \phi_1 \cos \phi_2 + \sin \phi_1 \sin \phi_2) + \cos \theta_1 \cos \theta_2)}$$

$$= \sqrt{(r_1 - r_2)^2 + 2r_1r_2[1 - \cos(\phi_1 - \phi_2)\sin\theta_1\sin\theta_2 - \cos\theta_1\cos\theta_2]}$$

14. 设在球面 $r = a$ 上有两个点 (a, θ_1, ϕ_1) 和 (a, θ_2, ϕ_2) . 证明这两个点之间的球面距离是 $a\gamma$ ($0 \leq \gamma \leq \pi$), 其中 γ 满足

$$\cos \gamma = \cos(\phi_1 - \phi_2) \sin \theta_1 \sin \theta_2 + \cos \theta_1 \cos \theta_2$$

解:

$$\begin{aligned} \therefore |AB| &= \sqrt{2a^2(1 - \cos(\phi_1 - \phi_2) \sin \theta_1 \sin \theta_2 - \cos \theta_1 \cos \theta_2)} \\ \therefore \sin \frac{\gamma}{2} &= \frac{\frac{1}{2}|AB|}{a} = \frac{|AB|}{2a} \\ \Rightarrow \cos \gamma &= 1 - 2 \sin^2 \frac{\gamma}{2} = 1 - \frac{2a^2}{2a^2} (1 - \cos(\phi_1 - \phi_2) \sin \theta_1 \sin \theta_2 - \cos \theta_1 \cos \theta_2) \\ &= \cos(\phi_1 - \phi_2) \sin \theta_1 \sin \theta_2 + \cos \theta_1 \cos \theta_2 \\ \therefore \widehat{AB} &= a\gamma, \quad \cos \gamma = \cos(\phi_1 - \phi_2) \sin \theta_1 \sin \theta_2 + \cos \theta_1 \cos \theta_2 \end{aligned}$$

9 多变量函数的微分学

9.1 习题 多变量函数及其连续性

1. 证明: $(A \cap B)^c = A^c \cup B^c, (A \cup B)^c = A^c \cap B^c$.

证明 (1) 对 $\forall a \in (A \cap B)^c, a \notin A \cap B, a \notin A$ 或者 $a \notin B \therefore a \in A^c$ 或者 $a \in B^c \therefore a \in A^c \cup B^c \therefore (A \cap B)^c \subseteq A^c \cup B^c$; 对 $\forall a \in A^c \cup B^c, a \in A^c$ or $B^c, a \notin A$ or $a \notin B, a \notin A \cap B, a \in (A \cap B)^c \therefore A^c \cup B^c \subseteq (A \cap B)^c$.

$$\begin{cases} (A \cap B)^c \subseteq A^c \cup B^c \\ A^c \cup B^c \subseteq (A \cap B)^c \end{cases}, (A \cap B)^c = A^c \cup B^c$$

(2) $a \in (A \cup B)^c \therefore a \notin A \cup B, a \notin A$ 且 $a \notin B \therefore a \in A^c$ 且 $a \in B^c \therefore a \in A^c \cap B^c, (A \cup B)^c = A^c \cap B^c$. □

2. 证明: 两个开集的交集和并集仍是开集, 两个闭集的交集和并集仍是闭集.

概念准备 开集: 设 $E \subset R$, 如果 E 中的每一个点都是 E 的内点, 则称 E 为开集.

闭集: 设 $E \subset R^n$, 如果 E 的每一个聚点都属于 E , 则称 E 为闭集.

证明: (1) 两个开集的并集是开集显然, 现证两个开集的交集仍是开集.

不妨设 G_1, G_2 为开集, 任取 $P_0 \in G_1 \cap G_2$. 存在 $r_i > 0$ 使 $B(P_0, r_i) \subset G_i (i = 1, 2)$. 取 $r = \min\{r_1, r_2\}$, 则 $B(P_0, r) \subset G_1 \cap G_2$, 故 $G_1 \cap G_2$ 为开集. □

★ 注意: 任意多个开集的交不一定是开集. 例如, $G_n = (-1 - \frac{1}{n}, 1 + \frac{1}{n}) (n = 1, 2, 3, \dots)$, 每个 G_n 是开集, 但 $\bigcap_{n=1}^{\infty} G_n = [-1, 1]$ 不是开集.

(2) 由 (1) 证明得到一个 **定理**: 任意多个开集之并仍是开集, 有限个开集之交仍是开集. 设 $F_i, i \in \Lambda$ (或 $i = 1, 2, \dots, m$), 是闭集. 故知各 F_i^c 是开集, 于是由 (1) 中定理知 $\bigcup_{i \in \Lambda} F_i^c$ (或 $\bigcap_{i=1}^m F_i^c$) 也是开集.

$$\therefore \left(\bigcup_{i \in \Lambda} F_i^c \right)^c = \bigcap_{i \in \Lambda} F_i \text{ (或 } \left(\bigcap_{i=1}^m F_i^c \right)^c = \bigcup_{i=1}^m F_i) \text{ 是闭集}$$

□

★ 注意: 任意多个闭集的和不一定是闭集. 例如, $F_n = [\frac{1}{n}, 1 - \frac{1}{n}], n = 3, 4, \dots$, 每个 F_n 都是闭集, 而 $\bigcup_{n=3}^{\infty} F_n = (0, 1)$ 不是闭集.

通过 (2) 证明得到一个 **定理'**: 任意多个闭集之交仍为闭集, 有限多个闭集之并仍为闭集.

3. 证明满足 $y > ax + b$ 的所有点 (x, y) 是一个开集. 在座标轴上画出它的范围, 并求它的边界点应满足的关系.

证明: 令 $g(x, y) = y - ax - b$, 则 g 连续, 且 $E = \{(x, y) : y > ax + b\} = g^{-1}((0, +\infty))$, 故 E 是开集; 其边界为 $\partial E = \{(x, y) : y = ax + b\}$.

4. 设 $\lim M_n = M_0, \lim M'_n = M'_0$. 求证: $\lim \rho(M_n, M'_n) = \rho(M_0, M'_0)$.

证明: $\rho(M_0, M'_0) - \rho(M_n, M_0) - \rho(M'_n, M'_0) \leq \rho(M_n, M'_n) \leq \rho(M_n, M_0) + \rho(M_0, M'_0) + \rho(M'_n, M'_0)$
由

$$\begin{aligned} & \lim_{n \rightarrow \infty} (\rho(M_0, M'_0) - \rho(M_n, M_0) - \rho(M'_n, M'_0)) \\ &= \lim_{n \rightarrow \infty} (\rho(M_n, M_0) + \rho(M_0, M'_0) + \rho(M'_n, M'_0)) = \rho(M_0, M'_0) \end{aligned}$$

及两边夹 Th 知, $\lim_{n \rightarrow \infty} \rho(M_n, M'_n) = \rho(M_0, M'_0)$. □

5. 证明: 平面上收敛的点列必然是有界的.

(类比收敛数列的证法)

回忆: 令 $a_n \rightarrow A (n \rightarrow +\infty)$, $\forall \varepsilon_0 > 0$, $\exists N \in \mathbb{N}^*, n > N, |a_n - A| < \varepsilon_0$.
 $\Rightarrow |a_n - A| + |A| < \varepsilon_0 + |A|$, 取 $M = \max\{|a_1|, |a_2|, \dots, |a_n|, \varepsilon_0 + |A|\}$
 $\therefore |a_n| \leq M$ 恒成立 ($\forall n \in \mathbb{N}^*$), 故收敛数列必定有界

证明: 令 $M_n \rightarrow M_0 (n \rightarrow +\infty)$, $\forall \rho_0 > 0$, $\exists N \in \mathbb{N}^*, n > N, \rho(M_n, M_0) < \rho_0$.
 $\rho(O, M_n) \leq \rho(O, M_0) + \rho(M_n, M_0) < \rho_0 + \rho(O, M_0)$, $n > N$,
 取 $R = \max\{\rho(O, M_1), \dots, \rho(O, M_N), \rho_0 + \rho(O, M_0)\}$,
 $\therefore \rho(O, M_n) \leq R$ 恒成立 ($\forall n \in \mathbb{N}^*$), 故平面收敛点列必定有界. □

6. 证明集合 $E = \{(x, y) : y = \sin \frac{1}{x}, 0 < x \leq \frac{2}{\pi}\} \cup \{(0, y) : 0 \leq y \leq 1\}$ 是连通的但不是道路连通的.

证明: 记

$$G = \left\{ \left(x, \sin \frac{1}{x} \right) : 0 < x \leq \frac{2}{\pi} \right\}, \quad F_0 = \{(0, y) : 0 \leq y \leq 1\}.$$

G 是区间 $(0, 2/\pi]$ 的连续像, 故连通; 又 $F_0 \subset \overline{G}$, 所以 $G \subset E = G \cup F_0 \subset \overline{G}$, 从而 E 连通.

下证 E 不道路连通. 若存在 E 中的道路 $\gamma(t) = (x(t), y(t))$ ($0 \leq t \leq 1$) 连接 $(0, 0)$ 与 G 中一点, 令 $t_0 = \max\{t : x(t) = 0\}$, 则 $t_0 < 1$, 且 $x(t) > 0$ 对所有 $t > t_0$ 成立. 由连续性, $x(t) \rightarrow 0^+$ 当 $t \downarrow t_0$; 同时 $\gamma(t) \in G$, 故 $y(t) = \sin(1/x(t))$. 连续函数 $1/x(t)$ 在任意区间 $(t_0, t_0 + \delta)$ 上的像

是无上界区间, 因而可分别取趋于 t_0 的两列参数, 使 $1/x(t)$ 等于 $\pi/2 + 2k\pi$ 与 $3\pi/2 + 2k\pi$. 于是相应的 $y(t)$ 分别等于 1 与 -1, 这与 $y(t)$ 在 t_0 处连续矛盾. 故 E 不是道路连通的. $\square$

7. 确定并画出以下函数的定义域, 并指出它们是否是区域, 是否是闭区域. (1)

$$z = \sqrt{x+y} \quad (2) \quad z = \sqrt{x-2y^2} \quad (3) \quad z = \frac{\sqrt{x^2+y^2+2x}}{\sqrt{2x-x^2-y^2}} \quad (4) \quad z = \sqrt{\sin(x^2+y^2)}$$

$$(5) \quad z = \ln\left(1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}\right) \quad (6) \quad z = \sqrt{\cos x \sin y} \quad (7) \quad u = \arcsin \frac{\sqrt{x^2+y^2}}{z} \quad (8) \quad u = \sqrt{2az - x^2 - y^2 - z^2} (a > 0)$$

解: (1) $x+y \geq 0$ 闭区域

(2) $x-2y^2 \geq 0$ 闭区域

$$(3) \begin{cases} x^2 + y^2 + 2x \geq 0 \\ 2x - x^2 - y^2 > 0 \end{cases} \quad \text{开区域}$$

$$(4) \sin(x^2+y^2) \geq 0, \quad x^2+y^2 \in [2k\pi, (2k+1)\pi] \quad \text{非区域}$$

$$(5) \frac{x^2}{a^2} + \frac{y^2}{b^2} < 1, \quad \text{开区域}$$

$$(6) \cos x \sin y \geq 0$$

$$\begin{cases} x \in [(2k - \frac{1}{2})\pi, (2k + \frac{1}{2})\pi] \\ y \in [2n\pi, (2n+1)\pi] \end{cases} \quad \& \quad \begin{cases} x \in [(2k + \frac{1}{2})\pi, (2k + \frac{3}{2})\pi] \\ y \in [(2n-1)\pi, 2n\pi] \end{cases} \quad \text{非区域}$$

$$(7) z \neq 0, \quad \sqrt{x^2+y^2} \leq |z| \quad \text{非区域}$$

$$(8) x^2 + y^2 + z^2 \leq 2az \quad \text{闭区域}$$

8. 画出函数 $z = \cos(2x+y)$ 的略图以及对应于 $z = 0, \pm 1, \pm \frac{1}{2}$ 的等高线.

$$\text{等高线: } z = 0 : 2x + y = k\pi + \frac{\pi}{2}$$

$$z = \pm 1 : 2x + y = k\pi$$

$$z = \pm \frac{1}{2} : 2x + y = k\pi \pm \frac{\pi}{3}$$

9. 一个变量的一般形式的 n 次多项式共有 $n+1$ 项单项式 $x^0, x^1, \dots, x^n$, 如果对于两个变量而言, 单项式定义为 $x^k y^l$, 次数定义为 $k+l$, 问一般形式的 n 次二元多项式一共有多少项, 推广到 k 个变量的情形呢?

$$\text{解: } \frac{(n+1)(n+2)}{2} \quad \frac{1}{k!} (n+1)(n+2) \cdots (n+k)$$

10. 设 $f(x, y) = \frac{2xy}{x^2 + y^2}$, 求 $f(1, 1), f(y, x), f\left(1, \frac{y}{x}\right), f(u, v), f(\cos t, \sin t)$.

$$\begin{aligned} f(1, 1) &= 1, \quad f(y, x) = \frac{2xy}{x^2 + y^2}, \quad f\left(1, \frac{y}{x}\right) = \frac{2xy}{x^2 + y^2}, \\ f(u, v) &= \frac{2uv}{u^2 + v^2}, \quad f(\cos t, \sin t) = \frac{2 \cos t \sin t}{\cos^2 t + \sin^2 t} = \sin 2t. \end{aligned}$$

11. 设 $f(x, y) = \begin{cases} 1, & y \geq x, \\ 0, & y < x, \end{cases}$ 又 $\begin{cases} x = \cos t, \\ y = \sin t \end{cases}$ 求 $F(t) = f(\cos t, \sin t)$

$$\text{解: } F(t) = \begin{cases} 1, & t \in [2k\pi + \frac{\pi}{4}, 2k\pi + \frac{5\pi}{4}] \\ 0, & t \in (2k\pi - \frac{3\pi}{4}, 2k\pi + \frac{\pi}{4}) \end{cases}$$

12. 设 $f(x + y, \frac{y}{x}) = x^2 - y^2 (x \neq 0)$, 求 $f(2, 3), f(x, y)$.

$$f(2, 3) = -2 \quad f(x, y) = x^2 \cdot \frac{1-y}{1+y}$$

13. 设 $f(x, y) = x^y, \varphi(x, y) = x + y, \psi(x, y) = x - y$, 求 $f[\varphi(x, y), \psi(x, y)], \varphi[f(x, y), \psi(x, y)], \psi[\varphi(x, y), f(x, y)]$

解:

$$f[\varphi(x, y), \psi(x, y)] = (x + y)^{x - y},$$

$$\varphi[f(x, y), \psi(x, y)] = x^y + x - y,$$

$$\psi[\varphi(x, y), f(x, y)] = x + y - x^y.$$

14. 判断下列各题极限是否存在, 若有极限, 求出其极限: (1) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 + y^2}{|x| + |y|}$; (2) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow a}} \frac{\sin xy}{x}$ (3) $\lim_{\substack{x \rightarrow +\infty \\ y \rightarrow +\infty}} \left(\frac{xy}{x^2 + y^2} \right)^{x^2}$ (4) $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow a}} \left(1 + \frac{1}{x} \right)^{\frac{x^2}{x+y}}$ (5) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^3 + y^3}{x^2 + y^2}$; (6) $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x^2 + y^2}{x^4 + y^4}$; (7) $\lim_{\substack{x \rightarrow +\infty \\ y \rightarrow +\infty}} (x^2 + y^2) e^{-(x+y)}$ (8) $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 0}} \frac{\ln(x + e^y)}{\sqrt{x^2 + y^2}}$ (9) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{xy}{\sqrt{xy+1}-1}$; (10) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{\sqrt{xy+1}-1}{x+y}$ (11) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{1 - \cos(x^2 + y^2)}{(x^2 + y^2)x^2 y^2}$ (12) $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (1 + xy)^{\frac{1}{x+y}}$

解:

$$(1) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 + y^2}{|x| + |y|} \leq \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \sqrt{x^2 + y^2} = 0$$

$$(2) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow a}} \frac{\sin xy}{x} = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow a}} \frac{\sin xy}{xy} \cdot y = a$$

$$(3) \lim_{\substack{x \rightarrow +\infty \\ y \rightarrow +\infty}} \left| \frac{xy}{x^2 + y^2} \right|^{x^2} \leq \lim_{x \rightarrow +\infty} \left(\frac{1}{2} \right)^{x^2} = 0$$

$$(4) \frac{x^2}{x+y} \ln \left(1 + \frac{1}{x} \right) \rightarrow 1, \quad \therefore \lim_{x \rightarrow +\infty} \left(1 + \frac{1}{x} \right)^{\frac{x^2}{x+y}} = e$$

$$(5) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \left| \frac{x^3 + y^3}{x^2 + y^2} \right| \leq \lim_{r \rightarrow 0^+} r (\sin^3 \theta + \cos^3 \theta) \leq \lim_{r \rightarrow 0^+} 2r = 0$$

$$(6) x^2 + y^2 \leq \sqrt{2(x^4 + y^4)}, \quad 0 \leq \frac{x^2 + y^2}{x^4 + y^4} \leq \sqrt{\frac{2}{x^4 + y^4}} \rightarrow 0$$

$$(7) 0 \leq (x^2 + y^2)e^{-(x+y)} \leq (x+y)^2 e^{-(x+y)} \rightarrow 0$$

$$(8) \lim_{\substack{x \rightarrow 1 \\ y \rightarrow 0}} \frac{\ln(x + e^y)}{\sqrt{x^2 + y^2}} = \ln 2 \quad (\text{由连续性})$$

$$(9) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{xy}{\sqrt{xy+1}-1} = \lim_{x \rightarrow 0} (\sqrt{xy+1} + 1) = 2$$

(10) 沿 $y = x$ 时极限为 0; 沿 $y = -x + kx^2$ ($k \neq 0$) 时极限为 $-\frac{1}{2k}$, 故极限不存在

(11) 当 $u = x^2 + y^2$ 充分小时, $1 - \cos u \geq \frac{u^2}{4}$, 故

$$\frac{1 - \cos(x^2 + y^2)}{(x^2 + y^2)x^2y^2} \geq \frac{1}{4} \left(\frac{1}{x^2} + \frac{1}{y^2} \right) \rightarrow +\infty$$

(12) 取 $x_n = 0$, $y_n = \frac{1}{n}$ 时, 极限为 1; 取 $x_n = \frac{1}{n}$, $y_n = -\frac{1}{n} + \frac{1}{n^2}$ 时,

$$\frac{\ln(1 + x_n y_n)}{x_n + y_n} \rightarrow -1, \quad \text{故原式趋于 } e^{-1}. \text{ 因而二元极限不存在.}$$

15. 若 $x = \rho \cos \varphi$, $y = \rho \sin \varphi$, 问沿怎样的方向 φ ($0 \leq \varphi \leq 2\pi$), 下列极限存在. (1) $\lim_{\rho \rightarrow 0^+} e^{\frac{1}{x^2 - y^2}}$ (2) $\lim_{\rho \rightarrow +\infty} e^{x^2 - y^2} \cdot \sin 2xy$.

解:

$$(1) x^2 - y^2 = \rho^2 (\cos^2 \varphi - \sin^2 \varphi) = \rho^2 \cos 2\varphi$$

$$\lim_{\rho \rightarrow 0^+} e^{\frac{1}{x^2 - y^2}} = \lim_{\rho \rightarrow 0^+} e^{\frac{1}{\rho^2 \cos 2\varphi}}$$

$$\therefore \cos 2\varphi < 0, \quad \varphi \in \left(\frac{\pi}{4}, \frac{3\pi}{4} \right) \cup \left(\frac{5\pi}{4}, \frac{7\pi}{4} \right)$$

$$(2) 2xy = \rho^2 \sin 2\varphi \Rightarrow e^{x^2 - y^2} \sin(2xy) = e^{\rho^2 \cos 2\varphi} \sin(\rho^2 \sin 2\varphi)$$

$$\therefore \cos 2\varphi < 0 / \sin 2\varphi = 0, \Rightarrow \varphi \in \{0\} \cup \left(\frac{\pi}{4}, \frac{3\pi}{4} \right) \cup \{\pi\} \cup \left(\frac{5\pi}{4}, \frac{7\pi}{4} \right) \cup \{2\pi\}$$

16. 证明: 当极限 $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = A$ 存在时, (1) 若 $y \neq y_0$ 时, $\lim_{x \rightarrow x_0} f(x,y)$ 存在, 则 $\lim_{y \rightarrow y_0} \lim_{x \rightarrow x_0} f(x,y) = A$; (2) 若 $x \neq x_0$ 时, $\lim_{y \rightarrow y_0} f(x,y)$ 存在, 则 $\lim_{x \rightarrow x_0} \lim_{y \rightarrow y_0} f(x,y) = A$.

证明:

$$(1) \because \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = A \Rightarrow \forall \varepsilon > 0. \exists \delta > 0, \text{ 当 } 0 < \sqrt{(x-x_0)^2 + (y-y_0)^2} < \delta \text{ 时, } |f(x,y) - A| < \frac{\varepsilon}{2}$$

$$\text{当 } 0 < |y - y_0| < \delta, \quad x \rightarrow x_0 \text{ 时 } \left| \lim_{x \rightarrow x_0} f(x,y) - A \right| = \lim_{x \rightarrow x_0} |f(x,y) - A| \leq \frac{\varepsilon}{2} < \varepsilon$$

$$\therefore \lim_{y \rightarrow y_0} \lim_{x \rightarrow x_0} f(x,y) = A$$

$$(2) \because \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = A \Rightarrow \forall \varepsilon > 0. \exists \delta > 0, \text{ 当 } 0 < \sqrt{(x-x_0)^2 + (y-y_0)^2} < \delta \text{ 时, } |f(x,y) - A| < \frac{\varepsilon}{2}$$

$$\text{当 } 0 < |x - x_0| < \delta, \quad y \rightarrow y_0 \text{ 时 } \left| \lim_{y \rightarrow y_0} f(x,y) - A \right| = \lim_{y \rightarrow y_0} |f(x,y) - A| \leq \frac{\varepsilon}{2} < \varepsilon$$

$$\therefore \lim_{x \rightarrow x_0} \lim_{y \rightarrow y_0} f(x,y) = A$$

□

17. 研究下列函数的连续性: (1) $f(x,y) = \begin{cases} \frac{xy}{x-y}, & x \neq y \\ 0, & x = y \end{cases}$ (2) $f(x,y) = \begin{cases} x \sin \frac{1}{y}, & y \neq 0 \\ 0, & y = 0 \end{cases}$ (3) $f(x,y) = \begin{cases} \frac{x^2 y}{x^2 + y^2}, & (x,y) \neq (0,0) \\ 0, & (x,y) = (0,0) \end{cases}$ (4) $f(x,y) = \begin{cases} \frac{x-y}{x+y}, & x+y \neq 0 \\ 0, & x+y = 0 \end{cases}$

解:

$$(1) \begin{cases} x \neq y, & x-y, xy \text{ 都是连续函数, 所以 } f \text{ 连续.} \\ x_0 = y_0 = 0, & \frac{xy}{x-y} \Big|_{y=x-kx^2} = \frac{1-kx}{k} \rightarrow \frac{1}{k}, \text{ 所以不连续} \\ x_0 = y_0 = a \neq 0, & xy \rightarrow a^2 \neq 0 \text{ 而 } x-y \rightarrow 0, \text{ 故极限不存在, 所以不连续} \end{cases}$$

$$(2) \begin{cases} \left| x \sin \frac{1}{y} \right| \leq |x| \rightarrow 0, & (0,0) \text{ 点连续} \\ a \neq 0 \text{ 时, 沿 } x=a \text{ 有 } a \sin(1/y) \text{ 无极限, 故 } (a,0) \text{ 点不连续} \end{cases}$$

$$(3) \because \left| \frac{x^2 y}{x^2 + y^2} \right| = |x| \frac{|xy|}{x^2 + y^2} \leq \frac{|x|}{2}$$

由夹逼定理, $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y}{x^2 + y^2} = 0$ 故函数处处连续

$$(4) \begin{cases} x+y \neq 0, & f \text{ 连续} \\ x=y=0, & \lim_{\substack{x \rightarrow 0 \\ y=kx}} \frac{x-y}{x+y} = \frac{1-k}{1+k} \text{ 不存在, } (0,0) \text{ 点 } f \text{ 不连续} \\ x+y=0, x \neq y, & \lim_{x \rightarrow -a} \frac{x-y}{x+y} \text{ 不存在, } x+y=0 \text{ 上 } f \text{ 不连续} \end{cases}$$

18. 证明函数 $f(x, y) = \begin{cases} \frac{x^2 y}{x^4 + y^2}, & x^2 + y^2 > 0 \\ 0, & x^2 + y^2 = 0 \end{cases}$ 在点 $(0, 0)$ 沿着过此点的每一射线 $x = t \cos \alpha, y = t \sin \alpha, (0 \leq t < +\infty)$ 连续, 即 $\lim_{t \rightarrow 0} f(t \cos \alpha, t \sin \alpha) = f(0, 0)$. 但此函数在点 $(0, 0)$ 并不连续.

证明:

$$f(t \cos \alpha, t \sin \alpha) = \frac{t \cos^2 \alpha \sin \alpha}{t^2 \cos^4 \alpha + \sin^2 \alpha} \rightarrow 0 \quad (\sin \alpha \neq 0); \text{ 当 } \sin \alpha = 0 \text{ 时函数恒为 } 0.$$

$$f(x, kx^2) = \frac{k}{1 + k^2}, \text{ 不连续}$$

□

19. 设 $f(x, y)$ 在 $D \subset \mathbb{R}^2$ 上分别对 x 和 y 连续, 且关于变量 y 是单调的, 证明: $f(x, y)$ 在 D 上连续.

证明: 对 $\forall (x_0, y_0) \in D$, 往证 $f(x, y)$ 在 (x_0, y_0) 处连续. 对 $\forall \varepsilon > 0$, 由于 $f(x_0, y)$ 在 y_0 处连续, 从而 $\exists \delta_1 > 0$, 使得

$$|f(x_0, y_0 + \delta_1) - f(x_0, y_0 - \delta_1)| < \frac{\varepsilon}{4},$$

又函数 $f(x, y_0 + \delta_1)$ 在 x_0 处连续, 故 $\exists \delta_2 > 0$, 使得当 $|x - x_0| < \delta_2$ 时, 有

$$|f(x, y_0 + \delta_1) - f(x_0, y_0 + \delta_1)| < \frac{\varepsilon}{4},$$

同理, $\exists \delta_3 > 0$, 使得当 $|x - x_0| < \delta_3$ 时, 有

$$|f(x, y_0 - \delta_1) - f(x_0, y_0 - \delta_1)| < \frac{\varepsilon}{4},$$

又由于 $f(x, y)$ 关于 y 单调, 从而当 $|y - y_0| < \delta_1$ 时, 有

$$|f(x, y) - f(x, y_0)| \leq |f(x, y_0 + \delta_1) - f(x, y_0 - \delta_1)|,$$

最后, 函数 $f(x, y_0)$ 在 x_0 处连续, 从而 $\exists \delta_4 > 0$, 使得当 $|x - x_0| < \delta_4$ 时, 有

$$|f(x, y_0) - f(x_0, y_0)| < \frac{\varepsilon}{4}.$$

终上, 对 $\forall \varepsilon > 0$, 取 $\delta = \min \{\delta_1, \delta_2, \delta_3, \delta_4\} > 0$, 则当 $\begin{cases} |x - x_0| < \delta, \\ |y - y_0| < \delta, \text{ 时, 有} \\ (x, y) \in D \end{cases}$

$$\begin{aligned} |f(x, y) - f(x_0, y_0)| &\leq |f(x, y) - f(x, y_0)| + |f(x, y_0) - f(x_0, y_0)| \\ &\leq |f(x, y_0 + \delta_1) - f(x, y_0 - \delta_1)| + |f(x, y_0) - f(x_0, y_0)| \\ &\leq |f(x, y_0 + \delta_1) - f(x_0, y_0 + \delta_1)| + |f(x_0, y_0 + \delta_1) - f(x_0, y_0 - \delta_1)| \\ &\quad + |f(x_0, y_0 - \delta_1) - f(x, y_0 - \delta_1)| + |f(x, y_0) - f(x_0, y_0)| < \varepsilon, \end{aligned}$$

这正是 $f(x, y)$ 在 (x_0, y_0) 处连续.

说明 也可以利用

$$\begin{aligned} |f(x, y) - f(x_0, y_0)| &\leq \max \{|f(x, y_0 + \delta) - f(x_0, y_0)|, |f(x, y_0 - \delta) - f(x_0, y_0)|\}, \\ |f(x_0, y_0 \pm \delta_1) - f(x_0, y_0)| &< \varepsilon \\ |f(x, y_0 \pm \delta_1) - f(x_0, y_0 \pm \delta_1)| &< \varepsilon \\ \implies |f(x, y_0 \pm \delta_1) - f(x_0, y_0)| &< 2\varepsilon \end{aligned}$$

注: 为证 $f(x, y)$ 在 (x_0, y_0) 连续, 可找 (x_0, y_0) 的一个矩形邻域 $D_1 = [x_0 - \delta_1, x_0 + \delta_1] \times [y_0 - \delta_2, y_0 + \delta_2]$. 先利用 $f(x, y)$ 在直线 $x = x_0$ 上的连续性, 可进取 δ_2 足够小, 使 f 在 D_1 的上下边中点 $(x_0, y_0 \pm \delta_2)$ 的值与 $f(x_0, y_0)$ 的误差不超过 $\frac{1}{2}\varepsilon$; 然后再由 $f(x, y_0 \pm \delta_2)$ 在直线 $y = y_0 \pm \delta_2$ 上的连续性, 可取 δ_1 足够小, 使 f 在 D_1 的上下边上的值与 $f(x_0, y_0)$ 的误差不超过 ε . 最后利用 f 关于 y 的单调性, 即可得 f 在 D_1 上的值与 $f(x_0, y_0)$ 的误差不超过 ε . $\square$

20. 设 $D \subset \mathbb{R}^2$ 对任意 $(x, y) \in D$, 令 $f(x, y) = x$. 称其为 D 在 x 轴的投影函数. 证明投影函数是连续函数, 但是它不一定将闭集映成闭集.

证明: 记 $M = (x, y) \in D$, 对 $M_0 = (x_0, y_0) \in D$, 对 $\forall \varepsilon > 0$, 取 $\delta = \varepsilon$, 则当 $M \in B_\delta(M_0)$ 时, 有

$$|f(x, y) - f(x_0, y_0)| = |x - x_0| \leq \rho(M, M_0) < \delta = \varepsilon,$$

故 $f(x, y) = x$ 是连续函数. 取 $D = \{(x, y) \mid y \geq \frac{1}{x}, x \in \mathbb{R}^+\}$, 则 D 是一个闭集, 而 $f(D) = (0, +\infty)$ 不是一个闭集. $\square$

21. 给出二元函数 $f(x, y)$ 在 (x_0, y_0) 处收敛的 Cauchy 收敛准则完整的描述并证明之.

二元函数 Cauchy 收敛准则: 设 $f(M)$ 为定义在 $D \in \mathbb{R}^2$ 上的二元函数, M_0 为 D 的一个聚点. 极限 $\lim_{M \rightarrow M_0} f(M)$ 存在的充要条件是: 对任意的正数 ε , 总存在某正数 δ , 使得对任何 $M_1, M_2 \in U^0(M_0, \delta) \cap D$, 都有 $|f(M_1) - f(M_2)| < \varepsilon$. 证明: 必要性由三角不等式立即得到: 若 $f(M) \rightarrow A$, 取邻域使 $|f(M) - A| < \varepsilon/2$, 则 $|f(M_1) - f(M_2)| < \varepsilon$. 反之, 任取趋于 M_0 的点列 $\{M_n\} \subset D \setminus \{M_0\}$, 上述条件说明 $\{f(M_n)\}$ 是实数域中的 Cauchy 列, 故收敛. 对任意两条趋于 M_0 的点列交错排列后再应用该条件, 可知它们对应函数值的极限相同. 由函数极限的序列判别法, $\lim_{M \rightarrow M_0} f(M)$ 存在. $\square$

22. 设 $f(x, y)$ 在 (x_0, y_0) 处连续, $x = x(u, v)$, $y = y(u, v)$ 在 (u_0, v_0) 处连续. 用 $\varepsilon - \delta$ 语言证明复合函数 $f(x(u, v), y(u, v))$ 在 (u_0, v_0) 处连续.

证明: 记 $x_0 = x(u_0, v_0)$, $y_0 = y(u_0, v_0)$. 对任意 $\varepsilon > 0$, 由 f 在 (x_0, y_0) 处连续, 存在 $\eta > 0$, 使

$$\sqrt{(x - x_0)^2 + (y - y_0)^2} < \eta \implies |f(x, y) - f(x_0, y_0)| < \varepsilon.$$

由 $x(u, v), y(u, v)$ 在 (u_0, v_0) 处连续, 存在 $\delta > 0$, 使

$$\sqrt{(u - u_0)^2 + (v - v_0)^2} < \delta \implies \sqrt{(x(u, v) - x_0)^2 + (y(u, v) - y_0)^2} < \eta.$$

两式合并即得 $f(x(u, v), y(u, v))$ 在 (u_0, v_0) 处连续. $\square$

23. 设 $f(x, y) = \frac{1}{1-xy}$, $(x, y) \in [0, 1] \times [0, 1], (x, y) \neq (1, 1)$, 证明函数连续但不一致连续.

证明: 先证 $f(x, y)$ 在 $D = [0, 1] \times [0, 1] \setminus \{(1, 1)\}$ 上连续. 记 $\Delta x = x - x_0, \Delta y = y - y_0$, 则当 $(x, y) \rightarrow (x_0, y_0)$ 且 $(x, y) \in D$ 时, 有

$$\begin{aligned} |(1-xy) - (1-x_0y_0)| &= |x_0\Delta x + y_0\Delta y + \Delta x\Delta y| \leq |x_0\Delta x| + |y_0\Delta y| + |\Delta x\Delta y| \\ &\leq |\Delta x| + |\Delta y| + |\Delta x\Delta y| \rightarrow 0. \end{aligned}$$

故 $1-xy$ 连续; 又它在 D 上不为零, 所以其倒数 f 在 D 上连续. 即

$$\begin{aligned} \lim_{(x,y) \rightarrow (x_0,y_0)} (1-xy) &= 1-x_0y_0 \\ \implies \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) &= \frac{1}{\lim_{(x,y) \rightarrow (x_0,y_0)} (1-xy)} = \frac{1}{1-x_0y_0} = f(x_0, y_0), \end{aligned}$$

从而 $f(x, y)$ 在 D 上连续. 下证其不一致连续. 取 $\varepsilon_0 = \frac{1}{2} > 0$, 对 $\forall \delta_n = \frac{1}{n} > 0 (n \in \mathbb{N}^*)$, 取点 $S_n(1-\delta_n, 1), T_n(1-\frac{\delta_n}{2}, 1)$ 满足 $\rho(S_n, T_n) = \frac{\delta_n}{2} < \delta_n$, 但

$$\left| f(1-\delta_n, 1) - f\left(1-\frac{\delta_n}{2}, 1\right) \right| = \frac{1}{\delta_n} = n \geq 1 > \varepsilon_0,$$

故 $f(x, y)$ 在 $[0, 1] \times [0, 1] \setminus \{(1, 1)\}$ 上不一致连续. $\square$

9.2 习题 多变量函数的微分

1. 求下列各函数在指定点的偏微商: (1) 设 $f(x, y) = x + y - \sqrt{x^2 + y^2}$, 求 $f'_x(3, 4)$; (2) 设 $f(x, y) = \sin x^2 y$, 求 $f'_x(1, \pi)$; (3) 设 $f(x, y) = \ln [xy^2 + yx^2 + \sqrt{1 + (xy^2 + yx^2)^2}]$, 求 $f'_x(1, y), f'_y(1, y)$

解:

$$(1) f'_x = 1 - \frac{x}{\sqrt{x^2 + y^2}}, f'_x(3, 4) = \frac{2}{5}$$

$$(2) f'_x = 2y \cdot x \cos x^2 y, f'_x(1, \pi) = -2\pi$$

$$(3) \text{ 令 } u = x^2 y + xy^2, \therefore f(u) = \ln(u + \sqrt{1 + u^2})$$

$$\frac{\partial f}{\partial u} = \frac{1}{\sqrt{1 + u^2}}, f'_x = \frac{\partial f}{\partial u} \frac{\partial u}{\partial x}, f'_y = \frac{\partial f}{\partial u} \frac{\partial u}{\partial y}$$

$$f'_x = \frac{2xy + y^2}{\sqrt{1 + (xy^2 + x^2 y)^2}}, f'_y = \frac{2xy + x^2}{\sqrt{1 + (xy^2 + x^2 y)^2}}$$

$$f'_x(1, y) = \frac{2y + y^2}{\sqrt{1 + (y + y^2)^2}}, f'_y(1, y) = \frac{2y + 1}{\sqrt{1 + (y + y^2)^2}}$$

2. 求下列各函数对于每个自变量的偏微商: (1) $z = \frac{xe^y}{y^2}$ (2) $z = 3^{-\frac{y}{x}}$ (3) $z = \sin \frac{x}{y} \cos \frac{y}{x}$ (4) $z = \ln(x + \sqrt{x^2 + y^2})$ (5) $u = \arctan \frac{x+y}{x-y}$; (6) $u = e^{x(x^2+y^2+z^2)}$ (7) $u = x^{y^z}$ (8) $u = xe^{-z} + \ln(x + \ln y) + z$

解:

$$(1) \quad \frac{\partial z}{\partial x} = \frac{e^y}{y^2}, \quad \frac{\partial z}{\partial y} = \frac{xe^y(y-2)}{y^3}$$

$$(2) \quad \frac{\partial z}{\partial x} = 3^{-\frac{y}{x}} \ln 3 \left(-\frac{y}{x}\right)'_x = \frac{y 3^{-\frac{y}{x}} \ln 3}{x^2}$$

$$\frac{\partial z}{\partial y} = 3^{-\frac{y}{x}} \ln 3 \left(-\frac{y}{x}\right)'_y = -\frac{3^{-\frac{y}{x}} \ln 3}{x}$$

$$(3) \quad \frac{\partial z}{\partial x} = \frac{1}{y} \cos \frac{x}{y} \cos \frac{y}{x} + \frac{y}{x^2} \sin \frac{x}{y} \sin \frac{y}{x},$$

$$\frac{\partial z}{\partial y} = -\frac{x}{y^2} \cos \frac{x}{y} \cos \frac{y}{x} - \frac{1}{x} \sin \frac{x}{y} \sin \frac{y}{x}$$

$$(4) \quad \frac{\partial z}{\partial x} = \frac{1}{\sqrt{x^2 + y^2}}, \quad \frac{\partial z}{\partial y} = \frac{1}{x + \sqrt{x^2 + y^2}} \cdot \frac{y}{\sqrt{x^2 + y^2}}$$

$$(5) \quad \frac{\partial u}{\partial x} = \frac{1}{1 + \left(\frac{x+y}{x-y}\right)^2} \left(\frac{x+y}{x-y}\right)'_x = -\frac{y}{x^2 + y^2}$$

$$\frac{\partial u}{\partial y} = \frac{1}{1 + \left(\frac{x+y}{x-y}\right)^2} \frac{(x+y) + (x-y)}{(x-y)^2} = \frac{x}{x^2 + y^2}$$

$$(6) \quad \frac{\partial u}{\partial x} = e^{x(x^2+y^2+z^2)} (3x^2 + y^2 + z^2), \quad \frac{\partial u}{\partial y} = e^{x(x^2+y^2+z^2)} \cdot 2xy, \quad \frac{\partial u}{\partial z} = e^{x(x^2+y^2+z^2)} \cdot 2xz$$

$$(7) \quad \frac{\partial u}{\partial x} = y^z x^{(y^z-1)}, \quad \frac{\partial u}{\partial y} = x^{y^z} \ln x \cdot zy^{z-1}, \quad \frac{\partial u}{\partial z} = x^{y^z} \ln x \cdot y^z \ln y$$

$$(8) \quad \frac{\partial u}{\partial x} = e^{-z} + \frac{1}{x + \ln y}, \quad \frac{\partial u}{\partial y} = \frac{1}{y(x + \ln y)}, \quad \frac{\partial u}{\partial z} = -xe^{-z} + 1$$

3. 设 $f(x, y) = \int_1^{x^2 y} \frac{\sin t}{t} dt$, 求 $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}$.

解:

$$\frac{\partial f}{\partial x} = 2xy \frac{\sin(x^2 y)}{x^2 y}, \quad \frac{\partial f}{\partial y} = x^2 \frac{\sin(x^2 y)}{x^2 y}, \quad \left(\frac{\sin 0}{0} \text{ 按极限1 理解} \right)$$

4. 设 $f(x, y) = \begin{cases} y \sin \frac{1}{x^2+y^2}, & x^2 + y^2 \neq 0, \\ 0, & x^2 + y^2 = 0. \end{cases}$ 考察函数 $f(x, y)$ 在原点 $(0, 0)$ 的偏导数.

解:

$$f_x(0, 0) = \lim_{\Delta x \rightarrow 0} \frac{f(\Delta x, 0) - f(0, 0)}{\Delta x} = 0,$$

$$f_y(0, 0) = \lim_{\Delta y \rightarrow 0} \frac{f(0, \Delta y) - f(0, 0)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \sin \frac{1}{\Delta y^2} \text{ 不存在.}$$

5. 试明函数 $z = \sqrt{x^2 + y^2}$ 在点 $(0, 0)$ 连续但偏导数不存在.

证明:

$$\because \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \sqrt{x^2 + y^2} = 0 = z(0, 0), \quad \text{故函数在}(0, 0) \text{ 处连续.}$$

$$\because \lim_{h \rightarrow 0^+} \frac{|h|}{h} = 1 \neq -1 = \lim_{h \rightarrow 0^-} \frac{|h|}{h}, \quad \therefore f_x(0, 0) \text{ 不存在; 同理 } f_y(0, 0) \text{ 也不存在.}$$

□

6. 求曲面 $z = \frac{x^2+y^2}{4}$ 与平面 $y = 4$ 的交线在点 $(2, 4, 5)$ 处的切线与 Ox 轴的正向所成的角度.

解:

$$z'_x(2, 4) = \left. \frac{x}{2} \right|_{x=2} = 1 = \tan \alpha, \quad \therefore \alpha = \frac{\pi}{4}$$

7. 求曲线 $\begin{cases} z = \sqrt{x^2 + y^2 + 1} \\ x = 1 \end{cases}$ 上点 $(1, 1, \sqrt{3})$ 处的切线分别与 x 轴、 y 轴、 z 轴正向的夹角

解:

$$z = \sqrt{y^2 + 2}, x = 1, \text{ 故切向量垂直于 } Ox \text{ 轴, } \therefore \alpha = \frac{\pi}{2}$$

$$z'_y(1, 1) = \left(\frac{1}{\sqrt{y^2 + 2}} \right) \bigg|_{y=1} = \frac{\sqrt{3}}{3} = \tan \beta, \quad \beta = \frac{\pi}{6}$$

$$x = 1 \text{ 垂直于 } x \text{ 轴, } \gamma = \frac{\pi}{2} - \beta = \frac{\pi}{3}$$

8. 试明函数 $u = \frac{1}{\sqrt{t}} e^{-\frac{x^2}{4t}}$ 满足热传导方程 $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$.

证明:

$$\begin{aligned} \frac{\partial u}{\partial t} &= -\frac{1}{2t^{\frac{3}{2}}} e^{-\frac{x^2}{4t}} + \frac{1}{\sqrt{t}} e^{-\frac{x^2}{4t}} \left(-\frac{x^2}{4t} \right)'_t \\ &= -\frac{1}{2} t^{-\frac{3}{2}} e^{-\frac{x^2}{4t}} + \frac{x^2}{4} t^{-\frac{5}{2}} e^{-\frac{x^2}{4t}} \\ \frac{\partial^2 u}{\partial x^2} &= \frac{\partial \left(\frac{\partial u}{\partial x} \right)}{\partial x} = \frac{\partial}{\partial x} \left(-\frac{x}{2t^{\frac{3}{2}}} e^{-\frac{x^2}{4t}} \right) \\ &= -\frac{1}{2} t^{-\frac{3}{2}} e^{-\frac{x^2}{4t}} + \frac{x^2}{4} t^{-\frac{5}{2}} e^{-\frac{x^2}{4t}} \\ \therefore \frac{\partial u}{\partial t} &= \frac{\partial^2 u}{\partial x^2} \end{aligned}$$

□

9. 在下列各题中, 求 $\frac{\partial^2 z}{\partial x^2}, \frac{\partial^2 z}{\partial x \partial y}, \frac{\partial^2 z^2}{\partial y^2}$ (1) $z = \frac{x-y}{x+y}$; (2) $z = \arctan \frac{x+y}{1-xy}$ (3) $z = \ln(x + \sqrt{x^2 + y^2})$ (4) $z = \sin^2(ax + by)$ (5) $z = y^{\ln x}$; (6) $z = \arcsin(xy)$

解:

$$\begin{aligned}
(1) \quad & \frac{\partial z}{\partial x} = \frac{2y}{(x+y)^2}, \quad \frac{\partial z}{\partial y} = \frac{-2x}{(x+y)^2} \\
& \frac{\partial^2 z}{\partial x^2} = \frac{-4y}{(x+y)^3}, \quad \frac{\partial^2 z}{\partial x \partial y} = \frac{\partial}{\partial x} \left(\frac{-2x}{(x+y)^2} \right) = \frac{2x-2y}{(x+y)^3}, \quad \frac{\partial^2 z}{\partial y^2} = \frac{4x}{(x+y)^3} \\
(2) \quad & \text{令 } x = \tan \alpha, y = \tan \beta, \quad z = \arctan \frac{x+y}{1-xy} = \alpha + \beta = \arctan x + \arctan y \\
& \frac{\partial z}{\partial x} = \frac{1}{1+x^2}, \quad \frac{\partial z}{\partial y} = \frac{1}{1+y^2}, \quad \frac{\partial^2 z}{\partial x^2} = \frac{-2x}{(1+x^2)^2}, \quad \frac{\partial^2 z}{\partial x \partial y} = 0, \quad \frac{\partial^2 z}{\partial y^2} = \frac{-2y}{(1+y^2)^2} \\
(3) \quad & \frac{\partial z}{\partial x} = \frac{1}{\sqrt{x^2+y^2}}, \quad \frac{\partial z}{\partial y} = \frac{y}{(x+\sqrt{x^2+y^2})\sqrt{x^2+y^2}} \\
& \frac{\partial^2 z}{\partial x^2} = \frac{-x}{(x^2+y^2)^{\frac{3}{2}}}, \quad \frac{\partial^2 z}{\partial x \partial y} = \frac{-y}{(x^2+y^2)^{\frac{3}{2}}}, \\
& \frac{\partial^2 z}{\partial y^2} = \frac{x^3 + \sqrt{x^2+y^2}(x^2-y^2)}{(x^2+y^2)^{\frac{3}{2}}(x+\sqrt{x^2+y^2})^2} \\
(4) \quad & \frac{\partial z}{\partial x} = a \sin(2(ax+by)), \quad \frac{\partial z}{\partial y} = b \sin(2(ax+by)) \\
& \frac{\partial^2 z}{\partial x^2} = 2a^2 \cos(2(ax+by)), \quad \frac{\partial^2 z}{\partial x \partial y} = 2ab \cos(2(ax+by)), \quad \frac{\partial^2 z}{\partial y^2} = 2b^2 \cos(2(ax+by)) \\
(5) \quad & \because y^{\ln x} = x^{\ln y} = e^{\ln x \cdot \ln y}, \quad \frac{\partial z}{\partial x} = x^{\ln y - 1} \cdot \ln y, \quad \frac{\partial z}{\partial y} = y^{\ln x - 1} \ln x \\
& \frac{\partial^2 z}{\partial x^2} = \ln y (\ln y - 1) \cdot x^{\ln y - 2}, \quad \frac{\partial^2 z}{\partial x \partial y} = \frac{y^{\ln x - 1} (\ln x \ln y + 1)}{x}, \quad \frac{\partial^2 z}{\partial y^2} = \ln x (\ln x - 1) \cdot y^{\ln x - 2} \\
(6) \quad & \frac{\partial z}{\partial x} = \frac{y}{\sqrt{1-x^2y^2}}, \quad \frac{\partial z}{\partial y} = \frac{x}{\sqrt{1-x^2y^2}} \\
& \frac{\partial^2 z}{\partial x^2} = \frac{xy^3}{(1-x^2y^2)^{\frac{3}{2}}}, \quad \frac{\partial^2 z}{\partial x \partial y} = \frac{1}{(1-x^2y^2)^{\frac{3}{2}}}, \quad \frac{\partial^2 z}{\partial y^2} = \frac{x^3y}{(1-x^2y^2)^{\frac{3}{2}}}
\end{aligned}$$

10. 设 $u = e^{xyz}$, 求 $\frac{\partial^3 u}{\partial x \partial y \partial z}$, $\frac{\partial^3 u}{\partial x \partial y^2}$.

解:

$$\begin{aligned}
& \frac{\partial u}{\partial z} = xye^{xyz}, \quad \frac{\partial^2 u}{\partial y \partial z} = xe^{xyz} + xy(xz)e^{xyz} = (x+x^2yz)e^{xyz} \\
\text{(I)} \quad & \frac{\partial^3 u}{\partial x \partial y \partial z} = [(x+x^2yz)e^{xyz}]'_x \\
& = (1+2xyz)e^{xyz} + (x+x^2yz)e^{xyz} \cdot yz \\
& = (1+3xyz+x^2y^2z^2)e^{xyz} \\
\text{(II)} \quad & \frac{\partial^3 u}{\partial x \partial y^2} = \frac{\partial}{\partial x} \left(\frac{\partial}{\partial y} \left(\frac{\partial u}{\partial y} \right) \right) \\
& = (x^2z^2e^{xyz})'_x = 2xz^2e^{xyz} + x^2yz^3e^{xyz} \\
& = xz^2(2+xyz)e^{xyz}
\end{aligned}$$

11. 设 $r = \sqrt{x^2 + y^2 + z^2}$, 证明当 $r \neq 0$ 时有 (1) $\frac{\partial^2 r}{\partial x^2} + \frac{\partial^2 r}{\partial y^2} + \frac{\partial^2 r}{\partial z^2} = \frac{2}{r}$; (2) $\frac{\partial^2 \ln r}{\partial x^2} + \frac{\partial^2 \ln r}{\partial y^2} + \frac{\partial^2 \ln r}{\partial z^2} = \frac{1}{r^2}$; (3) $\frac{\partial^2}{\partial x^2} \frac{1}{r} + \frac{\partial^2}{\partial y^2} \frac{1}{r} + \frac{\partial^2}{\partial z^2} \frac{1}{r} = 0$

证明:

$$\begin{aligned}
 (1) \quad \frac{\partial^2 r}{\partial x^2} &= \frac{\partial}{\partial x} \left(\frac{\partial r}{\partial x} \right) = \left(\frac{x}{\sqrt{x^2 + y^2 + z^2}} \right)'_x \\
 &= \frac{\sqrt{x^2 + y^2 + z^2} - x \cdot \frac{x}{\sqrt{x^2 + y^2 + z^2}}}{x^2 + y^2 + z^2} \\
 &= \frac{x^2 + y^2 + z^2 - x^2}{(x^2 + y^2 + z^2)^{\frac{3}{2}}} = \frac{y^2 + z^2}{(x^2 + y^2 + z^2)^{\frac{3}{2}}} \\
 \text{由对称性} \therefore \quad \frac{\partial^2 r}{\partial x^2} + \frac{\partial^2 r}{\partial y^2} + \frac{\partial^2 r}{\partial z^2} &= \frac{2(x^2 + y^2 + z^2)}{(x^2 + y^2 + z^2)^{\frac{3}{2}}} = \frac{2}{r} \\
 (2) \quad \frac{\partial \ln r}{\partial x} &= \left[\frac{1}{2} \ln(x^2 + y^2 + z^2) \right]'_x = \frac{x}{x^2 + y^2 + z^2} \\
 \frac{\partial^2 \ln r}{\partial x^2} &= \left(\frac{x}{x^2 + y^2 + z^2} \right)'_x = \frac{y^2 + z^2 - x^2}{(x^2 + y^2 + z^2)^2} \\
 \text{由对称性} \therefore \quad \frac{\partial^2 \ln r}{\partial x^2} + \frac{\partial^2 \ln r}{\partial y^2} + \frac{\partial^2 \ln r}{\partial z^2} &= \frac{x^2 + y^2 + z^2}{(x^2 + y^2 + z^2)^2} = \frac{1}{r^2} \\
 (3) \quad \frac{\partial^{\frac{1}{r}}}{\partial x} &= -\frac{x}{(x^2 + y^2 + z^2)^{\frac{3}{2}}} \\
 \frac{\partial^2 \frac{1}{r}}{\partial x^2} &= \left(-\frac{x}{(x^2 + y^2 + z^2)^{\frac{3}{2}}} \right)'_x = \frac{2x^2 - y^2 - z^2}{(x^2 + y^2 + z^2)^{\frac{5}{2}}} \\
 \text{由对称性} \therefore \quad \frac{\partial^2 \frac{1}{r}}{\partial x^2} + \frac{\partial^2 \frac{1}{r}}{\partial y^2} + \frac{\partial^2 \frac{1}{r}}{\partial z^2} &= \frac{2(x^2 + y^2 + z^2) - 2(x^2 + y^2 + z^2)}{(x^2 + y^2 + z^2)^{\frac{5}{2}}} = 0
 \end{aligned}$$

12. 设

$$f(x, y) = \begin{cases} xy \frac{x^2 - y^2}{x^2 + y^2}, & x^2 + y^2 \neq 0 \\ 0, & x^2 + y^2 = 0 \end{cases}$$

证明函数的二阶偏导数存在, 但所有二阶偏导数 (特别是两个混合偏导数) 在 $(0, 0)$ 不连续, 且 $f''_{xy}(0, 0) \neq f''_{yx}(0, 0)$ (这个例子说明, 在函数在一点分别对 x 和 y 求导的次序不能交换, 其原因是非连续引起的).

证明: 当 $(x, y) \neq (0, 0)$ 时, 根据求导法则, 有

$$f'_x(x, y) = y \frac{x^2 - y^2 + xy \frac{2x(x^2 + y^2) - 2x(x^2 - y^2)}{(x^2 + y^2)^2}}{x^2 + y^2} = y \frac{x^4 - y^4 + 4x^2 y^2}{(x^2 + y^2)^2}, f'_y(x, y) = x \frac{x^4 - y^4 - 4x^2 y^2}{(x^2 + y^2)^2},$$

当 $(x, y) = (0, 0)$ 时, 根据偏导数定义, 有

$$f'_x(0, 0) = \lim_{x \rightarrow 0} \frac{f(x, 0) - f(0, 0)}{x - 0} = \lim_{x \rightarrow 0} \frac{0 - 0}{x} = 0, f'_y(0, 0) = \lim_{y \rightarrow 0} \frac{f(0, y) - f(0, 0)}{y - 0} = \lim_{y \rightarrow 0} \frac{0 - 0}{y} = 0$$

$$f''_{xy}(0,0) = \lim_{y \rightarrow 0} \frac{f'_x(0,y) - f'_x(0,0)}{y-0} = \lim_{y \rightarrow 0} \frac{\frac{-y^5}{y^4} - 0}{y} = -1, f''_{yx}(0,0) = \lim_{x \rightarrow 0} \frac{f'_y(x,0) - f'_y(0,0)}{x-0} = \lim_{x \rightarrow 0} \frac{x^5 - 0}{x^4} = 1$$

$$\therefore f''_{xy}(0,0) \neq f''_{yx}(0,0)$$

再次利用求导法则求出当 $(x,y) \neq (0,0)$ 时的 $f''_{xy}(x,y)$,

$$f''_{xy}(x,y) = \frac{x^4 - y^4 + 4x^2y^2}{(x^2 + y^2)^2} + y \frac{(-4y^3 + 8x^2y)(x^2 + y^2)^2 - (x^4 - y^4 + 4x^2y^2)4y(x^2 + y^2)}{(x^2 + y^2)^4}$$

$$\text{当 } (x,y) \text{ 沿 } x \text{ 轴趋于 } (0,0) \text{ 时 } y=0, \lim_{(x,y) \rightarrow (0,0)} f''_{xy}(x,y) = \lim_{x \rightarrow 0} \frac{x^4}{x^4} = 1$$

$$\text{当 } (x,y) \text{ 沿 } y \text{ 轴趋于 } (0,0) \text{ 时 } x=0, \lim_{y \rightarrow 0} f''_{xy}(0,y) = -1 \text{ 二者不相等,}$$

故二重极限 $\lim_{(x,y) \rightarrow (0,0)} f''_{xy}(x,y)$ 不存在, 因此二阶混合偏导函数 $f''_{xy}(x,y)$ 在 $(0,0)$ 点不连续, 同理可得 $f''_{yx}(x,y)$ 在 $(0,0)$ 点也不连续。 $\square$

13. 求下列函数的微分, 或在给定点的微分 (1) $z = \ln(x^2 + y^2)$ (2) $z = \frac{xy}{x^2 + y^2}$ (3) $u = \frac{s+t}{s-t}$; (4) $z = \arctan \frac{y}{x}$ (5) $z = \sin(xy)$ 在点 $(0,0)$; (6) $z = x^4 + y^4 - 4x^2y^2$ 在点 $(0,0), (1,1)$;

解:

$$\begin{aligned} \frac{\partial z}{\partial x} &= \frac{2x}{x^2 + y^2}, & \frac{\partial z}{\partial y} &= \frac{2y}{x^2 + y^2} & dz &= \frac{2x}{x^2 + y^2}dx + \frac{2y}{x^2 + y^2}dy \\ \frac{\partial z}{\partial x} &= \frac{y(y^2 - x^2)}{(x^2 + y^2)^2}, & \frac{\partial z}{\partial y} &= \frac{x(x^2 - y^2)}{(x^2 + y^2)^2} & dz &= \frac{y(y^2 - x^2)}{(x^2 + y^2)^2}dx + \frac{x(x^2 - y^2)}{(x^2 + y^2)^2}dy \\ \frac{\partial u}{\partial s} &= -\frac{2t}{(s-t)^2}, & \frac{\partial u}{\partial t} &= \frac{2s}{(s-t)^2} & du &= -\frac{2t}{(s-t)^2}ds + \frac{2s}{(s-t)^2}dt \\ \frac{\partial z}{\partial x} &= -\frac{y}{x^2 + y^2}, & \frac{\partial z}{\partial y} &= \frac{x}{x^2 + y^2} & dz &= -\frac{y}{x^2 + y^2}dx + \frac{x}{x^2 + y^2}dy \\ \frac{\partial z}{\partial x} &= y \cos(xy), & \frac{\partial z}{\partial y} &= x \cos(xy) & dz|_{(0,0)} &= 0dx + 0dy \\ \frac{\partial z}{\partial x} &= 4x^3 - 8y^2x, & \frac{\partial z}{\partial y} &= 4y^3 - 8x^2y, & dz|_{(0,0)} &= 0dx + 0dy, \quad dz|_{(1,1)} = -4dx - 4dy \end{aligned}$$

14. 设 f 和 g 是两个可微函数. 利用微分的定义和定理 9.14, 证明 $d(fg) = gdf + fdg$. (即首先分别写出 f 和 g 的增量的表达式, 分析 fg 的增量的表达式).

证明: 令 $\rho = \sqrt{h^2 + k^2}$. 由 f, g 可微,

$$\Delta f = df + o(\rho), \quad \Delta g = dg + o(\rho).$$

于是

$$\begin{aligned} \Delta(fg) &= (f + \Delta f)(g + \Delta g) - fg \\ &= gdf + fdg + go(\rho) + fo(\rho) + \Delta f \Delta g. \end{aligned}$$

又 $\Delta f = O(\rho)$, $\Delta g = O(\rho)$, 故 $\Delta f \Delta g = O(\rho^2) = o(\rho)$. 因此 $\Delta(fg) = gdf + fdg + o(\rho)$, 即 $d(fg) = gdf + fdg$. $\square$ 15. 根据可微的定义证明, 函数 $f(x,y) = \sqrt{|xy|}$ 在原点处不可微.

证明 (反证法). 假设 $f(x, y) = \sqrt{|xy|}$ 在原点处可微, 根据定义, $\exists A, B \in \mathbb{R}$, 使得

$$\sqrt{|hk|} = Ah + Bk + o(\sqrt{h^2 + k^2}), \quad \rho = \sqrt{h^2 + k^2} \rightarrow 0$$

上式中令 $k = 0 \Rightarrow 0 = Ah + o(|h|)(h \rightarrow 0) \Rightarrow A = 0$, 同理可得: $B = 0$, 故

$$\sqrt{|hk|} = o(\sqrt{h^2 + k^2}), \quad \rho = \sqrt{h^2 + k^2} \rightarrow 0$$

令 $h = k$, 得: $|h| = o(\sqrt{2}|h|)$, $\rho = \sqrt{2}|h| \rightarrow 0$ 这不成立, 故矛盾, 从而推出假设不成立, 函数 $f(x, y) = \sqrt{|xy|}$ 在原点处不可微. $\square$

16. 证明函数 $f(x, y) = \begin{cases} \frac{x^2 y}{x^2 + y^2}, & x^2 + y^2 \neq 0, \\ 0, & x^2 + y^2 = 0 \end{cases}$ 在点 $(0, 0)$ 连续且偏导数存在, 但在此点不可微.

证明: (1)

$$\because \left| \frac{x^2 y}{x^2 + y^2} \right| = |x| \frac{|xy|}{x^2 + y^2} \leq \frac{|x|}{2} \rightarrow 0 = f(0, 0) \Rightarrow f(x, y) \text{ 在 } (0, 0) \text{ 连续}$$

(2)

$$\frac{\partial f(0, 0)}{\partial x} = \lim_{h \rightarrow 0} \frac{f(h, 0) - f(0, 0)}{h} = 0 = \lim_{k \rightarrow 0} \frac{f(0, k) - f(0, 0)}{k} = \frac{\partial f(0, 0)}{\partial y} \Rightarrow f(x, y) \text{ 在 } (0, 0) \text{ 偏导数存在}$$

(3)

$$\begin{aligned} \Delta z &= f(h, k) - f(0, 0) = \frac{h^2 k}{h^2 + k^2} \\ dz &= f'_x(0, 0)dx + f'_y(0, 0)dy = 0 \\ \lim_{\rho \rightarrow 0} \frac{\Delta z - dz}{\rho} &= \lim_{\rho \rightarrow 0} \frac{h^2 k}{(h^2 + k^2)^{\frac{3}{2}}} \stackrel{\text{令 } k=mh}{=} \lim_{h \rightarrow 0^+} \frac{m}{(1 + m^2)^{\frac{3}{2}}} \neq 0 \\ &\Rightarrow f(x, y) \text{ 在 } (0, 0) \text{ 不可微} \end{aligned} \quad \square$$

17. 证明函数 $f(x, y) = \begin{cases} (x^2 + y^2) \sin \frac{1}{\sqrt{x^2 + y^2}}, & x^2 + y^2 \neq 0, \\ 0, & x^2 + y^2 = 0 \end{cases}$ 连续且偏导数存在, 但偏导数在点 $(0, 0)$ 不连续, 而 f 在原点 $(0, 0)$ 可微.

证明: (1)

$$\because \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^2 + y^2) \sin \frac{1}{\sqrt{x^2 + y^2}} (\text{有界变量乘以无穷小量为 } 0) = 0 = f(0, 0)$$

故 $f(x, y)$ 在 $(0, 0)$ 处连续.

(2)

$$f'_x(0, 0) = \lim_{x \rightarrow 0} \frac{x^2 \sin \frac{1}{|x|}}{x} = 0 = \lim_{y \rightarrow 0} \frac{y^2 \sin \frac{1}{|y|}}{y} = f'_y(0, 0)$$

故 $f(x, y)$ 在 $(0, 0)$ 处偏导数存在.

(3)

$$\frac{\partial f}{\partial x} = \begin{cases} 2x \sin \frac{1}{\sqrt{x^2 + y^2}} - \frac{x}{\sqrt{x^2 + y^2}} \cos \frac{1}{\sqrt{x^2 + y^2}} & , (x, y) \neq (0, 0) \\ 0 & , (x, y) = (0, 0) \end{cases}$$

$$\frac{\partial f}{\partial y} = \begin{cases} 2y \sin \frac{1}{\sqrt{x^2 + y^2}} - \frac{y}{\sqrt{x^2 + y^2}} \cos \frac{1}{\sqrt{x^2 + y^2}} & , (x, y) \neq (0, 0) \\ 0 & , (x, y) = (0, 0) \end{cases}$$

$$\therefore \lim_{\substack{y \rightarrow 0 \\ x \rightarrow 0}} f'_y(x, y) = \lim_{x \rightarrow 0} \left(0 - \frac{y}{\sqrt{x^2 + y^2}} \cos \frac{1}{\sqrt{x^2 + y^2}} \right)$$

$$\stackrel{\text{取 } y=kx}{=} \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} - \frac{kx}{\sqrt{1+k^2}|x|} \cos \frac{1}{\sqrt{1+k^2}|x|} \text{ 不存在}$$

同理 $\lim_{\substack{y \rightarrow 0 \\ x \rightarrow 0}} f'_x(x, y)$ 也不存在, 故偏导数在点 $(0, 0)$ 处不连续.

(4) $f(x, y)$ 在 $(0, 0)$ 处可微充要条件: $\lim_{\rho \rightarrow 0} \frac{\Delta z|_{(0,0)} - dz|_{(0,0)}}{\rho} = 0$

$\therefore \Delta z = (h^2 + k^2) \sin \frac{1}{\sqrt{h^2 + k^2}} = o(\sqrt{h^2 + k^2})$ ($\rho = \sqrt{h^2 + k^2} \rightarrow 0$), $dz = 0$

$$\therefore \lim_{\substack{h \rightarrow 0 \\ k \rightarrow 0}} \frac{[f(h, k) - f(0, 0)] - \left[\frac{\partial f}{\partial x}(0, 0) \cdot h + \frac{\partial f}{\partial y}(0, 0) \cdot k \right]}{\sqrt{h^2 + k^2}} = \lim_{\rho \rightarrow 0} \frac{(h^2 + k^2) \sin \frac{1}{\sqrt{h^2 + k^2}}}{\sqrt{h^2 + k^2}} = \lim_{\rho \rightarrow 0} \rho \sin \frac{1}{\rho} = 0$$

故函数 $f(x, y)$ 在 $(0, 0)$ 处可微. □

18. 对下列函数, 求出关于 x 和 y 的所有一阶和二阶 (含混合) 偏导数. (1) $z = u \ln v$, 其中 $u = x^2, v = \frac{1}{1+y}$; (2) $z = u \arctan v$, 其中 $u = \frac{xy}{x-y}, v = x^2y + y - x$.

解:

(1) $z = -x^2 \ln(1 + y),$

$$z_x = -2x \ln(1 + y), \quad z_y = -\frac{x^2}{1 + y},$$

$$z_{xx} = -2 \ln(1 + y), \quad z_{xy} = z_{yx} = -\frac{2x}{1 + y}, \quad z_{yy} = \frac{x^2}{(1 + y)^2}.$$

(2) 记

$$p = \frac{xy}{x - y}, \quad q = x^2y + y - x, \quad A = \arctan q.$$

所需中间导数为

$$\begin{aligned} p_x &= -\frac{y^2}{(x - y)^2}, & p_y &= \frac{x^2}{(x - y)^2}, \\ p_{xx} &= \frac{2y^2}{(x - y)^3}, & p_{xy} &= -\frac{2xy}{(x - y)^3}, & p_{yy} &= \frac{2x^2}{(x - y)^3}, \\ q_x &= 2xy - 1, & q_y &= x^2 + 1, & q_{xx} &= 2y, & q_{xy} &= 2x, & q_{yy} &= 0. \end{aligned}$$

于是对 $i, j \in \{x, y\}$,

$$A_i = \frac{q_i}{1+q^2}, \quad A_{ij} = \frac{q_{ij}}{1+q^2} - \frac{2qq_iq_j}{(1+q^2)^2},$$

$$z_i = p_i A + p A_i,$$

$$z_{ij} = p_{ij} A + p_i A_j + p_j A_i + p A_{ij}.$$

这些公式依次给出 $z_x, z_y, z_{xx}, z_{xy} = z_{yx}, z_{yy}$, 且避免了原展开式中的漏项.

19. 求下列复合函数的偏导数或导数. (1) 设 $u = e^t + \arctan(t^2 + 1), t = x^y$, 求 $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}$; (2) 设 $u = e^{xyz}, x = rs, y = \frac{r}{s}, z = r^s$, 求 $\frac{\partial u}{\partial r}, \frac{\partial u}{\partial s}$; (3) 设 $u = \ln(x^2 + y^2), x = e^{t+s+r}, y = 4(s^2 + t^2)$, 求 $\frac{\partial u}{\partial r}, \frac{\partial u}{\partial s}, \frac{\partial u}{\partial t}$; (4) 设 $u = \frac{e^{ax}(y-z)}{a^2+1}, y = a \sin x, z = \cos x$, 求 $\frac{du}{dx}$;

解:

$$\begin{aligned} (1) \quad \frac{\partial u}{\partial x} &= \left(e^t + \frac{2t}{1+(t^2+1)^2} \right) y x^{y-1}, \quad \frac{\partial u}{\partial y} = \left(e^t + \frac{2t}{1+(t^2+1)^2} \right) x^y \ln x \\ (2) \quad \frac{\partial u}{\partial r} &= \frac{\partial u}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial u}{\partial z} \frac{\partial z}{\partial r}, \quad \frac{\partial u}{\partial s} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial u}{\partial z} \frac{\partial z}{\partial s} \\ &= y z e^{xyz} \cdot s + x z e^{xyz} \cdot \frac{1}{s} + x y e^{xyz} \cdot s \cdot r^{s-1}, \quad = y z e^{xyz} \cdot r + x z e^{xyz} \cdot \frac{-r}{s^2} + x y e^{xyz} \cdot r^s \ln r \\ &= e^{xyz} \left(y z s + \frac{x z}{s} + x y s r^{s-1} \right), \quad = e^{xyz} \left(y z r - \frac{x z r}{s^2} + x y r^s \ln r \right) = e^{xyz} x y r^s \ln r \\ (3) \quad \frac{\partial u}{\partial r} &= \frac{2x}{x^2 + y^2} e^{r+s+t}, \quad \frac{\partial u}{\partial s} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial s} \\ \frac{\partial y}{\partial s} &= \frac{2x}{x^2 + y^2} \cdot e^{r+s+t} + \frac{2y}{x^2 + y^2} \cdot 8s \\ \frac{\partial u}{\partial t} &= \frac{2x}{x^2 + y^2} e^{r+s+t} + \frac{2y}{x^2 + y^2} 8t \\ (4) \quad \frac{du}{dx} &= \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} \frac{dy}{dx} + \frac{\partial u}{\partial z} \frac{dz}{dx} = \frac{a e^{ax}(y-z)}{a^2+1} + \frac{e^{ax}}{a^2+1} \cdot a \cos x + \frac{e^{ax}}{a^2+1} \cdot \sin x = e^{ax} \sin x \end{aligned}$$

20. 求下列复合函数的偏导数或导数, 其中各题中的 f 均有连续的二阶偏导. (1) 设 $u = f(x, y), x = t^3, y = 2t^2$, 求 $\frac{du}{dt}$; (2) 设 $u = f(x, y, z), x = \sin t, y = \cos t, z = e^t$, 求 $\frac{du}{dt}$; (3) 设 $u = f(x^2 - y^2, e^{xy})$, 求 $\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial x \partial y}$; (4) 设 $u = f(x + y + z, x^2 + y^2 + z^2)$, 求 $\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial x^2}, \frac{\partial^2 u}{\partial x \partial y}$.

解:

$$(1) \frac{du}{dt} = \frac{\partial u}{\partial x} \frac{dx}{dt} + \frac{\partial u}{\partial y} \frac{dy}{dt} = f'_x(x, y)3t^2 + f'_y(x, y)4t$$

$$(2) \frac{du}{dt} = \frac{\partial u}{\partial x} \frac{dx}{dt} + \frac{\partial u}{\partial y} \frac{dy}{dt} + \frac{\partial u}{\partial z} \frac{dz}{dt} = f'_x \cos t - f'_y \sin t + f'_z e^t$$

$$(3) \frac{\partial u}{\partial x} = 2xf'_1 + ye^{xy}f'_2, \quad \frac{\partial^2 u}{\partial x \partial y} = \frac{\partial^2 u}{\partial y \partial x} = -4xyf''_{11} + 2x^2e^{xy}f''_{12} + e^{xy}(1+xy)f'_2 - 2y^2e^{xy}f''_{21} + xye^{2xy}f''_{22}$$

$$(4) \frac{\partial u}{\partial x} = f'_1 + 2xf'_2, \quad \frac{\partial^2 u}{\partial x^2} = f''_{11} + 2xf''_{12} + 2xf''_{21} + 2f'_2 + 4x^2f''_{22} = f''_{11} + 4xf''_{12} + 2f'_2 + 4x^2f''_{22}$$

$$\frac{\partial^2 u}{\partial x \partial y} = \frac{\partial^2 u}{\partial y \partial x} = f''_{11} + 2yf''_{12} + 2xf''_{21} + 4xyf''_{22} = f''_{11} + (2x+2y)f''_{12} + 4xyf''_{22}$$

21. 求函数 $u = xyz$ 在点 $(1, 2, -1)$ 沿方向 $l = (3, -1, 1)$ 的方向微商.

解:

$$\frac{\partial u}{\partial x} = yz, \quad \frac{\partial u}{\partial y} = xz, \quad \frac{\partial u}{\partial z} = xy, \quad \left. \frac{\partial u}{\partial x} \right|_{(1, 2, -1)} = -2, \quad \left. \frac{\partial u}{\partial y} \right|_{(1, 2, -1)} = -1, \quad \left. \frac{\partial u}{\partial z} \right|_{(1, 2, -1)} = 2$$

$$\text{grad} f = (-2, -1, 2), \quad \mathbf{e}_l = \left(\frac{3}{\sqrt{11}}, -\frac{1}{\sqrt{11}}, \frac{1}{\sqrt{11}} \right), \quad \frac{\partial f}{\partial \mathbf{e}_l} = \nabla f \cdot \mathbf{e}_l = \frac{-6}{\sqrt{11}} + \frac{1}{\sqrt{11}} + \frac{2}{\sqrt{11}} = -\frac{3\sqrt{11}}{11}$$

22. 试求函数 $z = \arctan \frac{y}{x}$ 在圆 $x^2 + y^2 - 2x = 0$ 上一点 $P\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ 处沿该圆周逆时针方向上的方向微商.

解:

$$\mathbf{e} = \left(-\frac{\sqrt{3}}{2}, -\frac{1}{2} \right), \quad \frac{\partial z}{\partial x} = \frac{1}{1 + \left(\frac{y}{x}\right)^2} \cdot \left(-\frac{y}{x^2} \right) = -\frac{y}{x^2 + y^2}, \quad \frac{\partial z}{\partial y} = \frac{1}{1 + \left(\frac{y}{x}\right)^2} \cdot \frac{1}{x} = \frac{x}{x^2 + y^2}$$

$$\left. \frac{\partial z}{\partial x} \right|_{\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)} = -\frac{\sqrt{3}}{2}, \quad \left. \frac{\partial z}{\partial y} \right|_{\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)} = \frac{1}{2}, \quad \frac{\partial f}{\partial \mathbf{e}} = \nabla f \cdot \mathbf{e} = \left(-\frac{\sqrt{3}}{2}, \frac{1}{2} \right) \cdot \left(-\frac{\sqrt{3}}{2}, -\frac{1}{2} \right) = \frac{1}{2}$$

23. 求函数 $u = x^2 + 2y^2 + 3z^2 + xy + 3x - 2y - 6z$ 在点 $(1, 1, -1)$ 的梯度和最大方向微商.

解:

$$\frac{\partial u}{\partial x} = 2x + y + 3, \quad \frac{\partial u}{\partial y} = 4y + x - 2, \quad \frac{\partial u}{\partial z} = 6z - 6, \quad \nabla u = (6, 3, -12), \quad \mathbf{e} = (\cos \alpha, \cos \beta, \cos \gamma)$$

$$\frac{\partial u}{\partial \mathbf{e}} = \nabla u \cdot \mathbf{e} \leq |\nabla u| = 3\sqrt{21},$$

$$\text{最大方向微商为 } 3\sqrt{21}, \quad \text{取得方向为 } \mathbf{e} = \frac{\nabla u}{|\nabla u|} = \frac{1}{\sqrt{21}}(2, 1, -4).$$

24. 设 $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $r = |\mathbf{r}|$, 试求 (1) $\text{grad} \frac{1}{r^2}$; (2) $\text{grad} \ln r$

$$\begin{aligned}\nabla \frac{1}{r^2} &= \nabla \frac{1}{x^2 + y^2 + z^2} = \left(-\frac{2x}{(x^2 + y^2 + z^2)^2}, -\frac{2y}{(x^2 + y^2 + z^2)^2}, -\frac{2z}{(x^2 + y^2 + z^2)^2} \right) \\ &= \left(-\frac{2x}{r^4}, -\frac{2y}{r^4}, -\frac{2z}{r^4} \right) = -\frac{2}{r^4} \mathbf{r} \\ \nabla \ln r &= \nabla \ln \sqrt{x^2 + y^2 + z^2} = \left(\frac{x}{x^2 + y^2 + z^2}, \frac{y}{x^2 + y^2 + z^2}, \frac{z}{x^2 + y^2 + z^2} \right) \\ &= \left(\frac{x}{r^2}, \frac{y}{r^2}, \frac{z}{r^2} \right) = \frac{1}{r^2} \mathbf{r}\end{aligned}$$

25. 设 $u = f(t), t = \varphi(xy, x + y)$, 其中 f, φ 分别具有连续的二阶导数及偏导数, 求 $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial^2 u}{\partial x \partial y}$

解:

$$\begin{aligned}\frac{\partial u}{\partial x} &= f'(t)(y \cdot \varphi'_1 + \varphi'_2), \quad \frac{\partial u}{\partial y} = f'(t)(x\varphi'_1 + \varphi'_2) \\ \frac{\partial^2 u}{\partial x \partial y} &= \frac{\partial}{\partial x} [f'(t)(x\varphi'_1 + \varphi'_2)] = f''(t)(x\varphi'_1 + \varphi'_2)(y \cdot \varphi'_1 + \varphi'_2) + f'(t) \frac{\partial}{\partial x} (x\varphi'_1 + \varphi'_2) \\ &= f''(t)(x\varphi'_1 + \varphi'_2)(y \cdot \varphi'_1 + \varphi'_2) + f'(t)(\varphi'_1 + xy\varphi''_{11} + x\varphi''_{12} + y\varphi''_{21} + \varphi''_{22}) \\ &= f''(t)(xy\varphi_1'^2 + (x+y)\varphi'_1\varphi'_2 + \varphi_2'^2) + f'(t)(\varphi'_1 + xy\varphi''_{11} + x\varphi''_{12} + y\varphi''_{21} + \varphi''_{22})\end{aligned}$$

26. 设 $z = f(xy), f$ 为可微函数. 证明 $x \frac{\partial z}{\partial x} - y \frac{\partial z}{\partial y} = 0$.

证明:

$$\frac{\partial z}{\partial x} = yf'(xy), \quad \frac{\partial z}{\partial y} = xf'(xy) \Rightarrow x \frac{\partial z}{\partial x} - y \frac{\partial z}{\partial y} = 0$$

□

27. 设 $z = f\left(\ln x + \frac{1}{y}\right), f$ 为可微函数. 证明 $x \frac{\partial z}{\partial x} + y^2 \frac{\partial z}{\partial y} = 0$.

证明:

$$\frac{\partial z}{\partial x} = \frac{1}{x} f' \left(\ln x + \frac{1}{y} \right), \quad \frac{\partial z}{\partial y} = -\frac{1}{y^2} f' \left(\ln x + \frac{1}{y} \right) \Rightarrow x \frac{\partial z}{\partial x} + y^2 \frac{\partial z}{\partial y} = 0$$

□

28. 证明函数 $u = \varphi(x - at) + \psi(x + at)$ 满足波动方程

$$\frac{\partial^2 u}{\partial t^2} = a^2 \frac{\partial^2 u}{\partial x^2}$$

其中 φ, ψ 有连续的二阶微商.

证明:

$$\frac{\partial u}{\partial t} = -a\varphi' + a\psi', \quad \frac{\partial u}{\partial x} = \varphi' + \psi', \quad \frac{\partial^2 u}{\partial t^2} = a^2\varphi'' + a^2\psi'', \quad \frac{\partial^2 u}{\partial x^2} = \varphi'' + \psi'' \Rightarrow \frac{\partial^2 u}{\partial t^2} = a^2 \frac{\partial^2 u}{\partial x^2}$$

□

29. 若 $u = F(x, y)$, F 任意二阶偏导存在, 而 $x = r \cos \varphi, y = r \sin \varphi$. 证明:

$$\left(\frac{\partial u}{\partial r}\right)^2 + \left(\frac{1}{r} \frac{\partial u}{\partial \varphi}\right)^2 = \left(\frac{\partial u}{\partial x}\right)^2 + \left(\frac{\partial u}{\partial y}\right)^2$$

证明:

$$\begin{aligned} \because \frac{\partial u}{\partial r} &= \frac{\partial u}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial r} = \frac{\partial u}{\partial x} \cos \varphi + \frac{\partial u}{\partial y} \sin \varphi \\ \frac{\partial u}{\partial \varphi} &= \frac{\partial u}{\partial x} \frac{\partial x}{\partial \varphi} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial \varphi} = \frac{\partial u}{\partial x} (-r \sin \varphi) + \frac{\partial u}{\partial y} r \cos \varphi \\ \therefore \left(\frac{\partial u}{\partial r}\right)^2 + \left(\frac{1}{r} \frac{\partial u}{\partial \varphi}\right)^2 &= \left(\frac{\partial u}{\partial x} \cos \varphi + \frac{\partial u}{\partial y} \sin \varphi\right)^2 + \left(-\frac{\partial u}{\partial x} \sin \varphi + \frac{\partial u}{\partial y} \cos \varphi\right)^2 = \left(\frac{\partial u}{\partial x}\right)^2 + \left(\frac{\partial u}{\partial y}\right)^2 \end{aligned}$$

□

30. 试证: 方程 $\frac{\partial^2 u}{\partial x^2} + 2\frac{\partial^2 u}{\partial x \partial y} - 3\frac{\partial^2 u}{\partial y^2} + 2\frac{\partial u}{\partial x} + 6\frac{\partial u}{\partial y} = 0$ 经变化 $\xi = x + y, \eta = 3x - y$ 后变成 $\frac{\partial^2 u}{\partial \eta \partial \xi} + \frac{1}{2} \frac{\partial u}{\partial \xi} = 0$. (其中二阶偏导数均连续)

证明:

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{\partial u}{\partial \xi} + 3\frac{\partial u}{\partial \eta}, \quad \frac{\partial u}{\partial y} = \frac{\partial u}{\partial \xi} - \frac{\partial u}{\partial \eta}, \\ \frac{\partial^2 u}{\partial x^2} &= \frac{\partial^2 u}{\partial \xi^2} + 6\frac{\partial^2 u}{\partial \xi \partial \eta} + 9\frac{\partial^2 u}{\partial \eta^2}, \\ \frac{\partial^2 u}{\partial x \partial y} &= \frac{\partial^2 u}{\partial \xi^2} + 2\frac{\partial^2 u}{\partial \xi \partial \eta} - 3\frac{\partial^2 u}{\partial \eta^2}, \\ \frac{\partial^2 u}{\partial y^2} &= \frac{\partial^2 u}{\partial \xi^2} - 2\frac{\partial^2 u}{\partial \xi \partial \eta} + \frac{\partial^2 u}{\partial \eta^2}. \\ \text{代入} \quad &\frac{\partial^2 u}{\partial x^2} + 2\frac{\partial^2 u}{\partial x \partial y} - 3\frac{\partial^2 u}{\partial y^2} + 2\frac{\partial u}{\partial x} + 6\frac{\partial u}{\partial y} = 0 \\ \text{得到} \quad &16u_{\xi\eta} + 8u_{\xi} = 0, \quad \text{即} \quad \frac{\partial^2 u}{\partial \eta \partial \xi} + \frac{1}{2} \frac{\partial u}{\partial \xi} = 0 \end{aligned}$$

□

31. 试证: 方程 $\frac{\partial^2 u}{\partial x^2} + 2\frac{\partial^2 u}{\partial x \partial y} \cos x - \frac{\partial^2 u}{\partial y^2} \sin^2 x - \frac{\partial u}{\partial y} \sin x = 0$ 经变换 $\xi = x - \sin x + y, \eta = x + \sin x - y$ 后变成 $\frac{\partial^2 u}{\partial \xi \partial \eta} = 0$. (其中二阶偏导数均连续)

证明:

$$\begin{aligned}\frac{\partial u}{\partial x} &= (1 - \cos x) \frac{\partial u}{\partial \xi} + (1 + \cos x) \frac{\partial u}{\partial \eta}, \quad \frac{\partial u}{\partial y} = \frac{\partial u}{\partial \xi} - \frac{\partial u}{\partial \eta} \\ \frac{\partial^2 u}{\partial x^2} &= \sin x \frac{\partial u}{\partial \xi} + (1 - \cos x)^2 \frac{\partial^2 u}{\partial \xi^2} + 2 \sin^2 x \frac{\partial u}{\partial \xi \partial \eta} - \sin x \frac{\partial u}{\partial \eta} + (1 + \cos x)^2 \frac{\partial^2 u}{\partial \eta^2} \\ \frac{\partial^2 u}{\partial x \partial y} &= (1 - \cos x) \frac{\partial^2 u}{\partial \xi^2} + 2 \cos x \frac{\partial^2 u}{\partial \xi \partial \eta} - (1 + \cos x) \frac{\partial^2 u}{\partial \eta^2} \\ \frac{\partial^2 u}{\partial y^2} &= \frac{\partial^2 u}{\partial \xi^2} - 2 \frac{\partial^2 u}{\partial \xi \partial \eta} + \frac{\partial^2 u}{\partial \eta^2} \\ \text{代入 } \frac{\partial^2 u}{\partial x^2} + 2 \frac{\partial^2 u}{\partial x \partial y} \cos x - \frac{\partial^2 u}{\partial y^2} \sin^2 x - \frac{\partial u}{\partial y} \sin x &= 0 \\ \text{得到 } \frac{\partial^2 u}{\partial \xi \partial \eta} &= 0\end{aligned}$$

□

32. 设变换 $\begin{cases} u = x - 2y, \\ v = x + ay \end{cases}$ 可把方程 $6 \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - \frac{\partial^2 z}{\partial y^2} = 0$ 简化为 $\frac{\partial^2 z}{\partial u \partial v} = 0$. 求常数 a. (其中二阶偏导数均连续)

解:

$$\begin{aligned}\frac{\partial z}{\partial x} &= \frac{\partial z}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial z}{\partial v} \frac{\partial v}{\partial x} = \frac{\partial z}{\partial u} + \frac{\partial z}{\partial v}, \\ \frac{\partial^2 z}{\partial x^2} &= \frac{\partial^2 z}{\partial u^2} + \frac{\partial^2 z}{\partial u \partial v} + \frac{\partial^2 z}{\partial v \partial u} + \frac{\partial^2 z}{\partial v^2} = \frac{\partial^2 z}{\partial u^2} + 2 \frac{\partial^2 z}{\partial u \partial v} + \frac{\partial^2 z}{\partial v^2}, \\ \frac{\partial^2 z}{\partial x \partial y} &= \frac{\partial^2 z}{\partial y \partial x} = -2 \left(\frac{\partial^2 z}{\partial u^2} + \frac{\partial^2 z}{\partial u \partial v} \right) + a \left(\frac{\partial^2 z}{\partial v \partial u} + \frac{\partial^2 z}{\partial v^2} \right) = -2 \frac{\partial^2 z}{\partial u^2} + (a - 2) \frac{\partial^2 z}{\partial u \partial v} + a \frac{\partial^2 z}{\partial v^2}, \\ \frac{\partial z}{\partial y} &= \frac{\partial z}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial z}{\partial v} \frac{\partial v}{\partial y} = -2 \frac{\partial z}{\partial u} + a \frac{\partial z}{\partial v}, \\ \frac{\partial^2 z}{\partial y^2} &= -2 \left(-2 \frac{\partial^2 z}{\partial u^2} + a \frac{\partial^2 z}{\partial u \partial v} \right) + a \left(-2 \frac{\partial^2 z}{\partial v \partial u} + a \frac{\partial^2 z}{\partial v^2} \right) = 4 \frac{\partial^2 z}{\partial u^2} - 4a \frac{\partial^2 z}{\partial u \partial v} + a^2 \frac{\partial^2 z}{\partial v^2}\end{aligned}$$

上式代入 $\because 6 \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - \frac{\partial^2 z}{\partial y^2} = 0$, 得到:

$$\begin{aligned}& 6 \left(\frac{\partial^2 z}{\partial u^2} + 2 \frac{\partial^2 z}{\partial u \partial v} + \frac{\partial^2 z}{\partial v^2} \right) - 2 \frac{\partial^2 z}{\partial u^2} + (a - 2) \frac{\partial^2 z}{\partial u \partial v} + a \frac{\partial^2 z}{\partial v^2} - \left(4 \frac{\partial^2 z}{\partial u^2} - 4a \frac{\partial^2 z}{\partial u \partial v} + a^2 \frac{\partial^2 z}{\partial v^2} \right) \\ &= (6 + 3a) \frac{\partial^2 z}{\partial u \partial v} + (4 + 2a) \frac{\partial^2 z}{\partial v \partial u} + (6 + a - a^2) \frac{\partial^2 z}{\partial v^2} = (10 + 5a) \frac{\partial^2 z}{\partial u \partial v} + (6 + a - a^2) \frac{\partial^2 z}{\partial v^2} = 0 \\ &\quad \therefore \begin{cases} 10 + 5a \neq 0, \\ 6 + a - a^2 = 0 \end{cases} \implies a = 3\end{aligned}$$

33. 求方程 $\frac{\partial z}{\partial y} = x^2 + 2y$ 满足条件 $z(x, x^2) = 1$ 的解 $z = z(x, y)$.

解

$$\frac{\partial z}{\partial y} = x^2 + 2y \xrightarrow{\text{积分}} z(x, y) = x^2 y + y^2 + c(x), \because z(x, x^2) = 1$$

$$\therefore c(x) = -2x^4 + 1, z(x, y) = -2x^4 + x^2 y + y^2 + 1$$

34. 设 $u = u(x, y)$, 当 $y = x^2$ 时有 $u = 1, \frac{\partial u}{\partial x} = x$, 求当 $y = x^2$ 时的 $\frac{\partial u}{\partial y}$.

解由题意得:

$$u(t, t^2) = 1, \frac{du}{dt} = \frac{\partial u}{\partial x}(t, t^2) + \frac{\partial u}{\partial y}(t, t^2) \cdot 2t = 0$$

$$\therefore \frac{\partial u}{\partial x}(t, t^2) = t, \quad \frac{\partial u}{\partial y}(t, t^2) = -\frac{1}{2}$$

$$\therefore \frac{\partial u}{\partial y}(x, x^2) = -\frac{1}{2}$$

35. 设 $u = u(x, y)$ 满足方程 $\frac{\partial^2 u}{\partial x^2} - \frac{\partial^2 u}{\partial y^2} = 0$ 以及条件 $u(x, 2x) = x, u'_x(x, 2x) = x^2$, 求 $u''_{xx}(x, 2x), u''_{xy}(x, 2x), u''_{yy}(x, 2x)$. (其中二阶偏导数均连续)

解:

$$u(x, 2x) \text{ 对 } x \text{ 求导得到, } u'_x(x, 2x) + 2u'_y(x, 2x) = 1$$

$$\because u'_x(x, 2x) = x^2, \quad \therefore u'_y(x, 2x) = \frac{1-x^2}{2} \quad \text{两式分别对 } x \text{ 求导,}$$

$$\begin{cases} u''_{yx}(x, 2x) + 2u''_{yy}(x, 2x) = -x \\ u''_{xx}(x, 2x) + 2u''_{xy}(x, 2x) = 2x \end{cases}$$

$$\text{加上条件 } \begin{cases} u''_{xx}(x, 2x) = u''_{yy}(x, 2x) \\ u''_{xy}(x, 2x) = u''_{yx}(x, 2x) \end{cases} \Rightarrow \begin{cases} u''_{xx}(x, 2x) = u''_{yy}(x, 2x) = -\frac{4}{3}x \\ u''_{xy}(x, 2x) = u''_{yx}(x, 2x) = \frac{5}{3}x \end{cases}$$

36. 求下列复合函数的微分 du (1) $u = f(t), t = x + y$; (2) $u = f(\xi, \eta), \xi = xy, \eta = \frac{x}{y}$ (3) $u = f(x, y, z), x = t, y = t^2, z = t^3$ (4) $u = f(x, \xi, \eta), \xi = x^2 + y^2, \eta = x^2 + y^2 + z^2$ (5) $u = f(\xi, \eta, \zeta), \xi = x^2 + y^2, \eta = x^2 - y^2, \zeta = 2xy$.

解: (1)

$$du = \frac{\partial f}{\partial t}(dx + dy)$$

(2)

$$du = \left(\frac{\partial f}{\partial \xi} y + \frac{\partial f}{\partial \eta} \frac{1}{y} \right) dx + \left(\frac{\partial f}{\partial \xi} x - \frac{\partial f}{\partial \eta} \frac{x}{y^2} \right) dy$$

(3)

$$du = (f'_1 + 2tf'_2 + 3t^2 f'_3) dt$$

(4)

$$du = (f'_1 + 2xf'_2 + 2xf'_3) dx + (2yf'_2 + 2yf'_3) dy + 2zf'_3 dz$$

(5)

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{\partial f}{\partial \xi} \cdot 2x + \frac{\partial f}{\partial \eta} \cdot 2x + \frac{\partial f}{\partial \zeta} \cdot 2y, & \frac{\partial u}{\partial y} &= \frac{\partial f}{\partial \xi} \cdot 2y + \frac{\partial f}{\partial \eta} \cdot (-2y) + \frac{\partial f}{\partial \zeta} \cdot 2x \\ \therefore du &= \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy = 2 \left(\frac{\partial f}{\partial \xi} x + \frac{\partial f}{\partial \eta} x + \frac{\partial f}{\partial \zeta} y \right) dx + 2 \left(\frac{\partial f}{\partial \xi} y - \frac{\partial f}{\partial \eta} y + \frac{\partial f}{\partial \zeta} x \right) dy \end{aligned}$$

37. 求在球坐标下的 Laplace 方程的形式.

$$\text{解: } \Delta u = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial u}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial u}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 u}{\partial \varphi^2}$$

38. 求直. 角坐标和极坐标的坐标变换 $x = x(r, \theta) = r \cos \theta, y = y(r, \theta) = r \sin \theta$ 的 Jacobi 行列式.

$$\text{解: } \frac{\partial(x, y)}{\partial(r, \theta)} = \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = \cos \theta \cdot r \cos \theta - \sin \theta \cdot (-r \sin \theta) = r$$

9.3 习题 隐函数定理/逆映射定理

1. 证明下列方程在指定点的附近对 y 有唯一解, 并求出 y 对 x 在该点处的一阶和二阶导数

(1) $x^2 + xy + y^2 = 7$, 在 $(2,1)$ 处. (2) $x \cos xy = 0$, 在 $(1, \frac{\pi}{2})$ 处.

解:

(1) 由隐函数存在定理, 方程在 $(2,1)$ 邻域内对 y 有唯一解

$$\frac{dy}{dx} = -\frac{F'_x}{F'_y} = -\frac{2x+y}{x+2y}, \therefore y' = \frac{dy}{dx} \Big|_{(2,1)} = -\frac{5}{4}$$

对 x 求导得到, $2x + y + xy' + 2yy' = 0$, $2 + y' + xy'' + 2y'y'' = 0$

$$\therefore x = 2, y = 1, y' = -\frac{5}{4}, \therefore y'' = \frac{d^2y}{dx^2} \Big|_{(2,1)} = -\frac{21}{32}$$

(2) $F(x, y) = x \cos(xy)$, $F_y(1, \pi/2) = -1 \neq 0$,

$$y' = -\frac{F'_x}{F'_y} = \frac{\cos(xy) - xy \sin(xy)}{x^2 \sin(xy)}, \quad y'(1, \pi/2) = -\frac{\pi}{2}.$$

在该邻域内 $\cos(xy) = 0$ 确定的分支为 $xy = \frac{\pi}{2}$, 即 $y = \frac{\pi}{2x}$, $\therefore y''(1) = \pi$.

2. 求由下列方程所确定的隐函数的导数.

(1) $\sin(xy) - e^{xy} - x^2y = 0$, 求 $\frac{dy}{dx}$; (2) $\ln \sqrt{x^2 + y^2} = \arctan \frac{y}{x}$, 求 $\frac{dy}{dx}$ 和 $\frac{d^2y}{dx^2}$; (3) $x^y = y^x$, 求 $\frac{dy}{dx}$ 和 $\frac{d^2y}{dx^2}$; (4) $e^{-xy} - 2z + e^z = 0$, 求 $\frac{\partial z}{\partial x}, \frac{\partial z}{\partial y}, \frac{\partial x}{\partial y}, \frac{\partial^2 z^2}{\partial x^2}$; (5) $\frac{x}{z} = \ln \frac{z}{y}$, 求 $\frac{\partial z}{\partial x}, \frac{\partial z}{\partial y}$; (6) $F(x, x+y, x+y+z) = 0$, 求 $\frac{\partial z}{\partial x}, \frac{\partial z}{\partial y}$; (7) $F(xz, yz) = 0$, 求 $\frac{\partial z}{\partial x}, \frac{\partial z}{\partial y}$

解: (1) $F'_x = y \cos(xy) - ye^{xy} - 2xy$, $F'_y = x \cos(xy) - xe^{xy} - x^2$

$$\frac{dy}{dx} = -\frac{F'_x}{F'_y} = -\frac{y \cos(xy) - ye^{xy} - 2xy}{x \cos(xy) - xe^{xy} - x^2}$$

$$(2) F'_x = \frac{x+y}{x^2+y^2}, F'_y = \frac{y-x}{x^2+y^2}$$

$$\frac{dy}{dx} = \frac{x+y}{x-y}, \frac{d^2y}{dx^2} = \frac{(1+\frac{\partial y}{\partial x})(x-y) - (1-\frac{\partial y}{\partial x})(x+y)}{(x-y)^2} = \frac{2(x^2+y^2)}{(x-y)^3}$$

(3) 对 $y \ln x - x \ln y = 0$ 隐式求导, 得

$$y' = \frac{y^2(\ln x - 1)}{x^2(\ln y - 1)}. \quad \text{令 } F = y \ln x - x \ln y, \text{ 则}$$

$$y'' = -\frac{F_{xx} + 2F_{xy}y' + F_{yy}(y')^2}{F_y} = -\frac{-\frac{y}{x^2} + 2\left(\frac{1}{x} - \frac{1}{y}\right)y' + \frac{x}{y^2}(y')^2}{\ln x - \frac{x}{y}}.$$

$$\begin{aligned}
(4) \quad & F'_x = -ye^{-xy}, \quad F'_y = -xe^{-xy}, \quad F'_z = e^z - 2 \\
& \frac{\partial z}{\partial x} = \frac{ye^{-xy}}{e^z - 2}, \quad \frac{\partial z}{\partial y} = \frac{xe^{-xy}}{e^z - 2}, \quad \frac{\partial x}{\partial y} = -\frac{x}{y}, \quad \frac{\partial y}{\partial x} = -\frac{y}{x} \\
& \frac{\partial^2 z}{\partial x^2} = \frac{-y^2 e^{-xy}(e^z - 2) - ye^{-xy}e^z z'_x}{(e^z - 2)^2} = \frac{-y^2 e^{-xy}}{(e^z - 2)^3} [(e^z - 2)^2 + e^{-xy}e^z] \\
(5) \quad & F'_x = \frac{1}{z}, \quad F'_y = \frac{1}{y}, \quad F'_z = -\frac{x+z}{z^2}, \quad \frac{\partial z}{\partial x} = \frac{z}{x+z}, \quad \frac{\partial z}{\partial y} = \frac{z^2}{y(x+z)} \\
(6) \quad & F'_x = F'_1 + F'_2 + F'_3, \quad F'_y = F'_2 + F'_3, \quad F'_z = F'_3 \\
& \frac{\partial z}{\partial x} = -\frac{F'_1 + F'_2 + F'_3}{F'_3}, \quad \frac{\partial z}{\partial y} = -\frac{F'_2 + F'_3}{F'_3} \\
(7) \quad & F'_x = zF'_1, \quad F'_y = z|'_2, \quad F'_3 = xF'_1 + yF'_2 \\
& \frac{\partial z}{\partial x} = -\frac{zF'_1}{xF'_1 + yF'_2}, \quad \frac{\partial z}{\partial y} = -\frac{zF'_2}{xF'_1 + yF'_2}
\end{aligned}$$

3. 找出满足方程 $x^2 + xy + y^2 = 27$ 的函数 $y = y(x)$ 的极大值与极小值.

解: $F(x, y) = x^2 + xy + y^2 - 27$, $F'_x = 2x + y$, $F'_y = 2y + x$

$\frac{dy}{dx} = -\frac{2x+y}{x+2y}$ 取极值时, 有 $\frac{dy}{dx} = 0 \Rightarrow 2x + y = 0$ 代入 $x^2 + xy + y^2 = 27$ 得: y 极大(小) 值为 ± 6

4. 试求由下列方程所确定的隐函数的微分. (1) $\cos^2 x + \cos^2 y + \cos^2 z = 1$, 求 dz ; (2) $xyz = x + y + z$, 求 dz ; (3) $u^3 - 3(x+y)u^2 + z^3 = 0$, 求 du ; (4) $F(x-y, y-z, z-x) = 0$, 求 dz .

$$\begin{aligned}
\text{解: (1)} \quad & F'_x = -\sin 2x, \quad F'_y = -\sin 2y, \quad F'_z = -\sin 2z \\
& \frac{\partial z}{\partial x} = -\frac{\sin 2x}{\sin 2z}, \quad \frac{\partial z}{\partial y} = -\frac{\sin 2y}{\sin 2z}, \quad dz = -\frac{\sin 2x}{\sin 2z} dx - \frac{\sin 2y}{\sin 2z} dy \\
(2) \quad & F'_x = yz - 1, \quad F'_y = xz - 1, \quad F'_z = xy - 1 \\
& \frac{\partial z}{\partial x} = -\frac{yz-1}{xy-1}, \quad \frac{\partial z}{\partial y} = -\frac{xz-1}{xy-1}, \quad dz = -\frac{yz-1}{xy-1} dx - \frac{xz-1}{xy-1} dy \\
(3) \quad & F'_x = -3u^2, \quad F'_y = -3u^2, \quad F'_z = 3z^2, \quad F'_u = 3u^2 - 6(x+y)u \\
& \frac{\partial u}{\partial x} = -\frac{F'_x}{F'_u} = \frac{u}{u-2(x+y)} = \frac{\partial u}{\partial y}, \quad \frac{\partial u}{\partial z} = \frac{3z^2}{6(x+y)u-3u^2}, \\
& du = \frac{u}{u-2(x+y)}(dx+dy) + \frac{z^2}{2(x+y)u-u^2} dz \\
(4) \quad & F'_x = F'_1 - F'_3, \quad F'_y = -F'_1 + F'_2, \quad F'_z = -F'_2 + F'_3 \\
& \frac{\partial z}{\partial x} = \frac{F'_1 - F'_3}{F'_2 - F'_3}, \quad \frac{\partial z}{\partial y} = \frac{F'_2 - F'_1}{F'_2 - F'_3}, \quad dz = \frac{F'_1 - F'_3}{F'_2 - F'_3} dx + \frac{F'_2 - F'_1}{F'_2 - F'_3} dy
\end{aligned}$$

5. 证明: 当 $1 + xy = k(x - y)$ (其中 k 为常数) 时有等式

$$\frac{dx}{1+x^2} = \frac{dy}{1+y^2}$$

证明: $F'_x = y - k, F'_y = x + k, \therefore \frac{dy}{dx} = \frac{k-y}{x+k}$
 $\because k = \frac{1+xy}{x-y}, x+k = \frac{1+xy}{x-y} + x = \frac{1+x^2}{x-y}, k-y = \frac{1+xy}{x-y} - y = \frac{y^2+1}{x-y}$
 $\therefore \frac{dy}{dx} = \frac{1+y^2}{1+x^2}$ 变形等到 $\frac{dx}{1+x^2} = \frac{dy}{1+y^2}$

□

6. 设 $z = z(x, y)$ 是由方程 $2\sin(x + 2y - 3z) = x + 2y - 3z$ 所确定的隐函数, 试证:
 $\frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} = 1$

证明: $F(x, y, z) = 2\sin(x + 2y - 3z) - x - 2y + 3z$

$$F'_x = 2\cos(x + 2y - 3z) - 1, F'_y = 4\cos(x + 2y - 3z) - 2, F'_z = -6\cos(x + 2y - 3z) + 3$$

$$\therefore \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} = -\frac{F'_x}{F'_z} - \frac{F'_y}{F'_z} = -\frac{6\cos(x + 2y - 3z) - 3}{3 - 6\cos(x + 2y - 3z)} = 1$$

□

7. 设 $z = z(x, y)$ 是由方程 $\varphi(cx - az, cy - bz) = 0$ 所确定的隐函数, 试证: 不论 φ 为怎样的可微函数, 都有 $a\frac{\partial z}{\partial x} + b\frac{\partial z}{\partial y} = c$.

证明: $\because \varphi'_x = c\varphi'_1, \varphi'_y = c\varphi'_2, \varphi'_z = -a\varphi'_1 - b\varphi'_2$
 $\therefore \frac{\partial z}{\partial x} = \frac{c\varphi'_1}{a\varphi'_1 + b\varphi'_2}, \frac{\partial z}{\partial y} = \frac{c\varphi'_2}{a\varphi'_1 + b\varphi'_2}, a\frac{\partial z}{\partial x} + b\frac{\partial z}{\partial y} = \frac{ac\varphi'_1 + bc\varphi'_2}{a\varphi'_1 + b\varphi'_2} = c$

□

8. 设 $z = x^2 + y^2$, 其中 $y = y(x)$ 为由方程 $x^2 - xy + y^2 = 1$ 所定义的函数, 求 $\frac{dz}{dx}$ 及 $\frac{d^2z}{dx^2}$

解: $\frac{\partial z}{\partial x} = 2x, \frac{\partial z}{\partial y} = 2y, \frac{\partial y}{\partial x} = -\frac{F'_x}{F'_y} = \frac{2x-y}{x-2y}$
 $\frac{dz}{dx} = \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial x} = \frac{2(x^2 - y^2)}{x - 2y}$
 $\frac{d^2z}{dx^2} = \frac{2 - 2y' + 2(y')^2}{x - 2y},$
 $\frac{d^2z}{dx^2} = 2 + 2(y')^2 + 2yy'', \quad y' = \frac{2x-y}{x-2y}.$

9. 设 $y = f(x+t)$, 而 t 是由方程 $y + g(x, t) = 0$ 所确定的 x, y 的函数, 求 $\frac{dy}{dx}$.

$$\text{解: } \begin{cases} \frac{\partial y}{\partial x} = f'_x \left(1 + \frac{\partial t}{\partial x}\right) \\ \frac{\partial y}{\partial x} + g'_1 + g'_2 \frac{\partial t}{\partial x} = 0 \end{cases} \Rightarrow \frac{\partial y}{\partial x} = f'_x \frac{g'_2 - g'_1}{g'_2 + f'_x}$$

10. 设 $x = x(z), y = y(z)$ 是方程组 $\begin{cases} x + y + z = 0, \\ x^2 + y^2 + z^2 = 1 \end{cases}$ 所确定的隐函数组, 求 $\frac{dx}{dz}, \frac{dy}{dz}$

$$\text{解: } \begin{cases} \frac{dx}{dz} + \frac{dy}{dz} + 1 = 0 \\ 2x \frac{dx}{dz} + 2y \frac{dy}{dz} + 2z = 0 \end{cases} \Rightarrow \begin{cases} \frac{dx}{dz} = \frac{y-z}{x-y} \\ \frac{dy}{dz} = \frac{z-x}{x-y} \end{cases}$$

11. 设 $u = u(x, y), v = v(x, y)$ 是由下列方程组所确定的隐函数组, 求 $\frac{\partial(u, v)}{\partial(x, y)}$.

$$(1) \begin{cases} u^2 + v^2 + x^2 + y^2 = 1 \\ u + v + x + y = 0 \end{cases} \quad (2) \begin{cases} xu - yv = 0 \\ yu + xv = 1 \end{cases} \quad (3) \begin{cases} u = f(ux, v + y) \\ v = g(u - x, v^2 y) \end{cases}$$

解: (1)

$$\begin{cases} \frac{\partial u}{\partial x} + \frac{\partial v}{\partial x} + 1 = 0 \\ u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} + x = 0 \end{cases} \Rightarrow \begin{cases} \frac{\partial u}{\partial x} = \frac{v-x}{u-v} \\ \frac{\partial v}{\partial x} = \frac{u-x}{v-u} \end{cases} \quad \text{而由} \begin{cases} \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y} + 1 = 0 \\ u \frac{\partial u}{\partial y} + v \frac{\partial v}{\partial y} + y = 0 \end{cases} \Rightarrow \begin{cases} \frac{\partial u}{\partial y} = \frac{v-y}{u-v} \\ \frac{\partial v}{\partial y} = \frac{u-y}{v-u} \end{cases}$$

$$\therefore \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial v}{\partial x} \frac{\partial u}{\partial y} = \frac{v-x}{u-v} \frac{u-y}{v-u} - \frac{u-x}{v-u} \frac{v-y}{u-v} = \frac{x-y}{u-v}$$

(2) 由方程组直接解得

$$u = \frac{y}{x^2 + y^2}, \quad v = \frac{x}{x^2 + y^2}.$$

因此

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{1}{(x^2 + y^2)^2} = \frac{u^2 + v^2}{x^2 + y^2}.$$

(3) 令

$$H_1 = u - f(ux, v + y), \quad H_2 = v - g(u - x, v^2 y).$$

则

$$\begin{aligned} \frac{\partial(H_1, H_2)}{\partial(u, v)} &= (1 - xf'_1)(1 - 2vyg'_2) - f'_2g'_1, \\ \frac{\partial(H_1, H_2)}{\partial(x, y)} &= uv^2f'_1g'_2 + f'_2g'_1. \end{aligned}$$

由隐函数组的 Jacobi 行列式公式,

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{uv^2f'_1g'_2 + f'_2g'_1}{(1 - xf'_1)(1 - 2vyg'_2) - f'_2g'_1}.$$

12. 求下列函数组所确定的反函数组的偏导数 $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$.

$$(1) \begin{cases} x = f(u, v), \\ y = g(u, v); \end{cases} \quad (2) \begin{cases} x = e^u + u \sin v \\ y = e^u - u \cos v \end{cases}$$

解: (1) 写出全微分

$$\begin{cases} dx = f'_u du + f'_v dv \\ dy = g'_u du + g'_v dv \end{cases}$$

$$\therefore du = \frac{D_1}{D} = \frac{\begin{vmatrix} dx & f'_v \\ dy & g'_v \end{vmatrix}}{\begin{vmatrix} f'_u & f'_v \\ g'_u & g'_v \end{vmatrix}} = \frac{g'_v dx - f'_v dy}{f'_u g'_v - f'_v g'_u}, dv = \frac{D_2}{D} = \frac{\begin{vmatrix} f'_u & dx \\ g'_u & dy \end{vmatrix}}{\begin{vmatrix} f'_u & f'_v \\ g'_u & g'_v \end{vmatrix}} = \frac{-g'_u dx + f'_u dy}{f'_u g'_v - f'_v g'_u},$$

$$\Rightarrow \frac{\partial u}{\partial x} = \frac{g'_v}{f'_u g'_v - f'_v g'_u}, \frac{\partial u}{\partial y} = -\frac{f'_v}{f'_u g'_v - f'_v g'_u}, \frac{\partial v}{\partial x} = -\frac{g'_u}{f'_u g'_v - f'_v g'_u}, \frac{\partial v}{\partial y} = \frac{f'_u}{f'_u g'_v - f'_v g'_u}$$

(2) 直接 $f(u, v) = e^u + u \sin v$, $g(u, v) = e^u - u \cos v$ 代入 (1) 中, 得到

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{\sin v}{(e^u(\sin v - \cos v) + 1)}, & \frac{\partial u}{\partial y} &= \frac{-\cos v}{(e^u(\sin v - \cos v) + 1)} \\ \frac{\partial v}{\partial x} &= \frac{-e^u + \cos v}{u(e^u(\sin v - \cos v) + 1)}, & \frac{\partial v}{\partial y} &= \frac{e^u + \sin v}{u(e^u(\sin v - \cos v) + 1)} \end{aligned}$$

13. 设 $u = f(x, y, z)$, $\varphi(x^2, e^y, z) = 0$, $y = \sin x$, 其中 f, φ 都具有一阶连续偏导数, 且 $\frac{\partial \varphi}{\partial z} \neq 0$. 求 $\frac{du}{dx}$.

解:

$$\begin{aligned} u'_x &= f'_1 + f'_2 y'_x + f'_3 z'_x = f'_1 + \cos x f'_2 + f'_3 z'_x \\ \varphi'_1 \cdot 2x + \varphi'_2 \cos x e^{\sin x} + \varphi'_3 z'_x &= 0, \quad z'_x = -\frac{2x\varphi'_1 + e^{\sin x} \cos x \varphi'_2}{\varphi'_3} \\ \therefore u'_x &= f'_1 + \cos x f'_2 - \frac{2x\varphi'_1 + e^{\sin x} \cos x \varphi'_2}{\varphi'_3} f'_3 \end{aligned}$$

14. 设 $y = y(x)$, $z = z(x)$ 是由方程 $z = xf(x+y)$ 和 $F(x, y, z) = 0$ 所确定的函数, 其中 f 和 F 分别具有一阶连续导数和一阶连续偏导数. 求 $\frac{dz}{dx}$. (此类型题一个等式含 y'_x, z'_x 另一个含 y'_x , 先求出先决条件/联立多方程求解线性方程组)

解:

$$\begin{aligned} z &= xf(x+y) \Rightarrow z'_x = f(x+y) + xf'(x+y)(1+y'_x) \\ F(x, y, z) &= 0 \Rightarrow F'_x + F'_y y'_x + F'_z z'_x = 0 \\ \begin{cases} xf'y'_x - z'_x = -f - xf' \\ F'_y y'_x + F'_z z'_x = -F'_x \end{cases} &\therefore \frac{dz}{dx} = \frac{(f + xf')F'_y - xf'F'_x}{F'_y + xf'F'_z} \end{aligned}$$

15. 设 $u = u(x, y), v = v(x, y)$ 是由方程 $F(x, y, u, v) = 0$ 和 $G(x, y, u, v) = 0$ 所确定的隐函数, 其中 F 和 G 都具有一阶连续偏导数. 求 du, dv .

解:

$$\begin{cases} F'_x dx + F'_y dy + F'_u du + F'_v dv = 0 \\ G'_x dx + G'_y dy + G'_u du + G'_v dv = 0 \end{cases} \Rightarrow \begin{cases} du = \frac{D_1}{D} \\ dv = \frac{D_2}{D} \end{cases}$$

其中

$$D = \begin{vmatrix} F'_u & F'_v \\ G'_u & G'_v \end{vmatrix}, \quad D_1 = \begin{vmatrix} -F'_x dx - F'_y dy & F'_v \\ -G'_x dx - G'_y dy & G'_v \end{vmatrix}, \quad D_2 = \begin{vmatrix} F'_u & -F'_x dx - F'_y dy \\ G'_u & -G'_x dx - G'_y dy \end{vmatrix}$$

$$du = \frac{(F'_v G'_x - F'_x G'_v) dx + (F'_v G'_y - F'_y G'_v) dy}{F'_u G'_v - F'_v G'_u}$$

$$dv = \frac{(F'_x G'_u - F'_u G'_x) dx + (F'_y G'_u - F'_u G'_y) dy}{F'_u G'_v - F'_v G'_u}$$

16. 函数 $u = u(x, y)$ 由方程组 $u = f(x, y, z, t), g(y, z, t) = 0, h(z, t) = 0$ 定义, 求 $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}$.

解: 对 $f(x, y, z, t), g(y, z, t) = 0, h(z, t) = 0$ 求全微分, 得到

$$\begin{cases} g'_1 dy + g'_2 dz + g'_3 dt = 0 \\ h'_1 dz + h'_2 dt = 0 \end{cases} \Rightarrow \begin{cases} dz = \frac{g'_1 h'_2}{g'_3 h'_1 - h'_2 g'_2} dy \\ dt = \frac{-g'_1 h'_1}{g'_3 h'_1 - h'_2 g'_2} dy \end{cases}$$

$$\therefore du = f'_1 dx + f'_2 dy + f'_3 dz + f'_4 dt$$

$$\therefore \frac{\partial u}{\partial x} = f'_1, \quad \frac{\partial u}{\partial y} = f'_2 + \frac{g'_1 h'_2 f'_3}{g'_3 h'_1 - h'_2 g'_2} - \frac{g'_1 h'_1 f'_4}{g'_3 h'_1 - h'_2 g'_2}$$

9.4 习题 空间曲线与曲面

1. 设 $\mathbf{r} = (a \sin t, -a \cos t, bt^2)$, a, b 是常数, 求 $\mathbf{r}'(t)$ 和 $\mathbf{r}''(t)$.

解: $\mathbf{r}'(t) = (a \cos t, a \sin t, 2bt)$ $\mathbf{r}''(t) = (-a \sin t, a \cos t, 2b)$

2. 设 $\mathbf{r}(t)$ 是单位向量, 试证明 $\frac{d\mathbf{r}}{dt} \perp \mathbf{r}$, 并说明它的几何意义.

证明: 由 $\mathbf{r}(t) \cdot \mathbf{r}(t) = 1$ 两边求导, 得

$$2\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0.$$

故 $\mathbf{r}'(t) \perp \mathbf{r}(t)$. 几何上, $\mathbf{r}(t)$ 的端点位于单位球面上, $\mathbf{r}'(t)$ (非零时) 是该轨迹的切向量, 因而位于单位球面的切平面内. $\square$

3. 证明曲线 $x = a \cos t, y = a \sin t, z = bt$ 的切线与 Oz 轴成定角.

证明:

$$\mathbf{r}'(t) = (-a \sin t, a \cos t, b)$$

$$\cos \langle \mathbf{r}'(t), Oz \rangle = \cos \gamma = \frac{b}{\sqrt{(-a \sin t)^2 + (a \cos t)^2 + b^2}} = \frac{b}{\sqrt{a^2 + b^2}}$$

故为定角 $\square$

4. 设 $\mathbf{r} = \left(\frac{t}{1+t}, \frac{1+t}{t}, t^2\right)$ ($t > 0$), 判断它是不是简单曲线, 是不是光滑曲线, 并求出它在 $t = 1$ 时的切线方程和法平面方程.

解: 对任意的 $t_1 \in (a, b)$ $t_2 \in [a, b]$, 只要 $t_1 \neq t_2$ 有 $\mathbf{r}(t_1) \neq \mathbf{r}(t_2)$, 则是简单曲线

对于 $\mathbf{r} = \left(\frac{t}{1+t}, \frac{1+t}{t}, t^2\right)$ ($t > 0$), 不同的 t 对应不同 x, y, z , 故是简单曲线

$$x'(t) = \frac{1}{(1+t)^2}, y'(t) = -\frac{1}{t^2}, z'(t) = 2t$$

$$\mathbf{r}'(t) = \left(\frac{1}{(1+t)^2}, -\frac{1}{t^2}, 2t\right) \neq \mathbf{0} \quad (t > 0), \text{ 故是光滑曲线.}$$

$$t = 1 \text{ 时, } \vec{r} = \left(\frac{1}{2}, 2, 1\right), \quad \vec{r}' = \left(\frac{1}{4}, -1, 2\right)$$

$$\text{切线: } \frac{x - \frac{1}{2}}{\frac{1}{4}} = \frac{y - 2}{-1} = \frac{z - 1}{2}$$

$$\text{法平面: } \frac{1}{4} \left(x - \frac{1}{2}\right) - (y - 2) + 2(z - 1) = 0$$

5. 求下列曲线的切线与法平面方程 (1) $x = a \sin^2 t, y = b \sin t \cos t, z = c \cos^2 t$, 在 $t = \frac{\pi}{4}$; (2) $x = t - \cos t, y = 3 + \sin^2 t, z = 1 + \cos 3t$, 在 $t = \frac{\pi}{2}$.

解: (1)

$$F'_x = 2a \sin t \cos t, \quad F'_y = b \cos 2t, \quad F'_z = -2c \cos t \sin t$$

$$t = \frac{\pi}{4} \text{ 时, } \vec{r} = \left(\frac{a}{2}, \frac{b}{2}, \frac{c}{2} \right), \quad \vec{r}' = (a, 0, -c)$$

$$\text{切线: } \frac{x - \frac{a}{2}}{a} = \frac{z - \frac{c}{2}}{-c}, \quad y = \frac{b}{2}$$

$$\text{法平面: } a \left(x - \frac{a}{2} \right) - c \left(z - \frac{c}{2} \right) = 0$$

(2)

$$F'_x = 1 + \sin t, \quad F'_y = 2 \sin t \cos t, \quad F'_z = -3 \sin 3t$$

$$t = \frac{\pi}{2} \text{ 时, } \vec{r} = \left(\frac{\pi}{2}, 4, 1 \right), \quad \vec{r}' = (2, 0, 3)$$

$$\text{切线: } \frac{x - \frac{\pi}{2}}{2} = \frac{z - 1}{3}, \quad y = 4$$

$$\text{法平面: } 2 \left(x - \frac{\pi}{2} \right) + 3(z - 1) = 0$$

6. 求下列曲面在所示点处的切平面与法线方程. (1) $x = u \cos v, y = u \sin v, z = av$, 在 (u_0, v_0) ; (2) $x = a \sin \theta \cos \varphi, y = b \sin \theta \sin \varphi, z = c \cos \theta$, 在 (θ_0, φ_0) .

解:

$$(1) \quad x'_u = \cos v, y'_u = \sin v, z'_u = 0, \quad \mathbf{r}'_u = (\cos v, \sin v, 0),$$

$$x'_v = -u \sin v, y'_v = u \cos v, z'_v = a, \quad \mathbf{r}'_v = (-u \sin v, u \cos v, a),$$

$$\mathbf{n} = \mathbf{r}'_u \times \mathbf{r}'_v = (a \sin v, -a \cos v, u)$$

$$\text{法线: } \frac{x - u_0 \cos v_0}{a \sin v_0} = \frac{y - u_0 \sin v_0}{-a \cos v_0} = \frac{z - av_0}{u_0},$$

$$\text{切平面: } a \sin v_0(x - u_0 \cos v_0) - a \cos v_0(y - u_0 \sin v_0) + u_0(z - av_0) = 0$$

$$(2) \quad \mathbf{r}'_\theta = (a \cos \theta \cos \varphi, b \cos \theta \sin \varphi, -c \sin \theta),$$

$$\mathbf{r}'_\varphi = (-a \sin \theta \sin \varphi, b \sin \theta \cos \varphi, 0),$$

$$\mathbf{n} = \mathbf{r}'_\theta \times \mathbf{r}'_\varphi = (bc \sin^2 \theta \cos \varphi, ac \sin^2 \theta \sin \varphi, ab \sin \theta \cos \theta).$$

$$\text{记 } P_0 = (x_0, y_0, z_0) = (a \sin \theta_0 \cos \varphi_0, b \sin \theta_0 \sin \varphi_0, c \cos \theta_0),$$

$$\text{切平面: } \frac{x_0 x}{a^2} + \frac{y_0 y}{b^2} + \frac{z_0 z}{c^2} = 1,$$

$$\text{法线: } \frac{x - x_0}{x_0/a^2} = \frac{y - y_0}{y_0/b^2} = \frac{z - z_0}{z_0/c^2}.$$

7. 设两条隐式曲线 $F(x, y) = 0$ 与 $G(x, y) = 0$ 在一点 (x_0, y_0) 相交, 求在交点处两条隐式曲线切线的夹角. 这里 $F(x, y), G(x, y)$ 是可微函数.

解:

$$\cos \theta = \frac{|\nabla F(x_0, y_0) \cdot \nabla G(x_0, y_0)|}{|\nabla F(x_0, y_0)| |\nabla G(x_0, y_0)|}, \quad 0 \leq \theta \leq \frac{\pi}{2}.$$

8. 求下列曲面在指定点的切平面和法线方程. (1) $z = \sqrt{x^2 + y^2} - xy$, 在点 $(3, 4, -7)$; (2) $z = \arctan \frac{y}{x}$, 在点 $(1, 1, \frac{\pi}{4})$; (3) $e^z - z + xy = 3$, 在点 $(2, 1, 0)$; (4) $4 + \sqrt{x^2 + y^2 + z^2} = x + y + z$, 在点 $(2, 3, 6)$.

解: (1)

$$F'_x = \frac{x}{\sqrt{x^2 + y^2}} - y, \quad F'_y = \frac{y}{\sqrt{x^2 + y^2}} - x, \quad F'_z = -1$$

$$\text{切平面: } F'_x(x - x_0) + F'_y(y - y_0) + F'_z(z - z_0) = 0 \Leftrightarrow -\frac{17}{5}(x - 3) - \frac{11}{5}(y - 4) - 1(z + 7) = 0$$

$$\text{法线: } \frac{x - 3}{-\frac{17}{5}} = \frac{y - 4}{-\frac{11}{5}} = \frac{z + 7}{-1}$$

(2)

$$F'_x = -\frac{y}{x^2 + y^2}, \quad F'_y = \frac{x}{x^2 + y^2}, \quad F'_z = -1$$

$$\text{切平面: } -\frac{1}{2}(x - 1) + \frac{1}{2}(y - 1) - \left(z - \frac{\pi}{4}\right) = 0$$

$$\text{法线: } \frac{x - 1}{-\frac{1}{2}} = \frac{y - 1}{\frac{1}{2}} = \frac{z - \frac{\pi}{4}}{-1}$$

(3)

$$F'_x = y, \quad F'_y = x, \quad F'_z = e^z - 1$$

$$\text{切平面: } (x - 2) + 2(y - 1) = 0$$

$$\text{法线: } \frac{x - 2}{1} = \frac{y - 1}{2}, \quad z = 0$$

(4)

$$F'_x = \frac{x}{\sqrt{x^2 + y^2 + z^2}} - 1, \quad F'_y = \frac{y}{\sqrt{x^2 + y^2 + z^2}} - 1, \quad F'_z = \frac{z}{\sqrt{x^2 + y^2 + z^2}} - 1$$

$$\text{切平面: } -\frac{5}{7}(x - 2) - \frac{4}{7}(y - 3) - \frac{1}{7}(z - 6) = 0$$

$$\text{法线: } \frac{x - 2}{-\frac{5}{7}} = \frac{y - 3}{-\frac{4}{7}} = \frac{z - 6}{-\frac{1}{7}}$$

9. 求椭球面 $x^2 + 2y^2 + z^2 = 1$ 上平行于平面 $x - y + 2z = 0$ 的切平面方程.

解: (应用到椭球面切平面的一般形式 $\frac{x_0(x - x_0)}{a^2} + \frac{y_0(y - y_0)}{b^2} + \frac{z_0(z - z_0)}{c^2} = 0$)

椭球面在 (x_0, y_0, z_0) 处的切平面为: $x_0x + 2y_0y + z_0z = 1$

$$\because \tau = (2x_0, 4y_0, 2z_0) // (1, -1, 2), \quad \text{令 } x_0 = t, y_0 = -\frac{t}{2}, z_0 = 2t$$

$$t^2 + 2\left(\frac{t}{2}\right)^2 + (2t)^2 = 1, \quad t = \pm\sqrt{\frac{2}{11}}$$

$$\therefore x - y + 2z = \pm\frac{\sqrt{22}}{2}.$$

10. 在曲面 $z = xy$ 上求一点, 使这点处的法线垂直于平面 $x + 3y + z = 0$, 并写出这个法线方程.

解:

$$\begin{aligned} F(x, y, z) &= z - xy, \tau = (F'_x, F'_y, F'_z) // (1, 3, 1) \\ \therefore F'_x &= -y_0, F'_y = -x_0, F'_z = 1 \\ \therefore x_0 &= -3, y_0 = -1, z_0 = 3 \Rightarrow \text{法线方程} \frac{x+3}{1} = \frac{y+1}{3} = \frac{z-3}{1} \end{aligned}$$

11. 求椭球面 $x^2 + 2y^2 + 3z^2 = 21$ 上某点 M 处的切平面 π 的方程, 使 π 过已知直线 $L: \frac{x-6}{2} = \frac{y-3}{1} = \frac{z-1}{-2}$.

解: (该问题有两种解法: 一是利用过已知直线的平面束方程中求一个与椭球相切的平面; 二是在椭球面上任一点的切平面中找一个通过一已知直线的切平面)

方法 1 由直线的对称式方程可得该直线的一般式方程为

$$\begin{cases} x - 2y = 0 \\ x + 2z - 7 = 0 \end{cases}$$

过此直线的平面束方程为

$$(x - 2y) + \lambda(x + 2z - 7) = 0$$

即 $(1 + \lambda)x - 2y + 2\lambda z - 7\lambda = 0$. 设点 M 的坐标为 (x_0, y_0, z_0) , 则在此点的切平面的法向量为 $\vec{n} = (2x_0, 4y_0, 6z_0)$, 切平面方程为

$$2x_0(x - x_0) + 4y_0(y - y_0) + 6z_0(z - z_0) = 0$$

$$\text{即 } x_0x + 2y_0y + 3z_0z - (x_0^2 + 2y_0^2 + 3z_0^2) = 0$$

$$\text{或 } x_0x + 2y_0y + 3z_0z - 21 = 0$$

$$\text{所以有 } \frac{x_0}{1+\lambda} = \frac{2y_0}{-2} = \frac{3z_0}{2\lambda} = \frac{-21}{-7\lambda} = t$$

$$\text{且 } x_0^2 + 2y_0^2 + 3z_0^2 = 21$$

$$\text{解得点的坐标为 } M(3, 0, 2) \text{ 或 } M_1(1, 2, 2),$$

所以切平面方程为

$$x + 2z - 7 = 0 \text{ 和 } x + 4y + 6z - 21 = 0.$$

方法 2 设切点坐标 $M_0(x_0, y_0, z_0)$, 由解法 1 可知, 点 M 处的切平面为

$$x_0x + 2y_0y + 3z_0z - 21 = 0$$

因为已知直线在此切平面上, 故其上任取两点如 $A\left(6, 3, \frac{1}{2}\right), B\left(0, 0, \frac{7}{2}\right)$ 在切平面上

所以 $6x_0 + 6y_0 + \frac{3}{2}z_0 - 21 = 0, z_0 = 2$, 且 $x_0^2 + 2y_0^2 + 3z_0^2 = 21$ 解得切点坐标为 $M(3, 0, 2)$ 或 $M_1(1, 2, 2)$, 所以切平面方程为

$$x + 2z - 7 = 0 \text{ 和 } x + 4y + 6z - 21 = 0$$

12. 设直线 $l: \begin{cases} x+y+b=0, \\ x+ay-z-3=0 \end{cases}$ 在平面 π 上, 而平面 π 与曲面: $z=x^2+y^2$ 相切于点 $(1, -2, 5)$, 求 a, b 之值.

解:

$$F'_x = 2x, \quad F'_y = 2y, \quad F'_z = -1$$

$$\text{得到法平面: } 2(x-1) - 4(y+2) - (z-5) = 0$$

直线一点参数形式 $(-t-b, t, (a-1)t-b-3)$ 代入平面方程:

$$2(-t-b) - 4t - ((a-1)t-b-3) - 5 = 0,$$

$$(-a-5)t - b - 2 = 0 \therefore a = -5, \quad b = -2$$

13. 试证曲面 $x^2 + y^2 + z^2 = ax$ 与曲面 $x^2 + y^2 + z^2 = by$ 互相正交.

证明:

$$\text{令 } F(x, y, z) = x^2 + y^2 + z^2 - ax, \quad G(x, y, z) = x^2 + y^2 + z^2 - by$$

$$\text{法向量 } \mathbf{n}_F = \text{grad} F = (2x-a, 2y, 2z), \quad \mathbf{n}_G = \text{grad} G = (2x, 2y-b, 2z)$$

$$\mathbf{n}_F \cdot \mathbf{n}_G = 2x(2x-a) + 2y(2y-b) + 4z^2 = 4(x^2 + y^2 + z^2) - 2ax - 2by = 0$$

□

14. 证明曲面 $x+2y-\ln z+4=0$ 和 $x^2-xy-8x+z+5=0$ 在点 $(2, -3, 1)$ 处相切 (即有公共的切平面).

证明:

$$F(x, y, z) = x+2y-\ln z+4, \quad G(x, y, z) = x^2-xy-8x+z+5$$

$$F'_x = 1, \quad F'_y = 2, \quad F'_z = -\frac{1}{z}, \quad G'_x = 2x-y-8, \quad G'_y = -x, \quad G'_z = 1$$

$$\text{在 } (2, -3, 1) \text{ 点处, } \nabla F = (1, 2, -1), \quad \nabla G = (-1, -2, 1) = -\nabla F,$$

$\therefore$ 两曲面在 $(2, -3, 1)$ 处有公共切平面, 故相切.

□

15. 证明曲面 $z = xe^{x/y}$ 的每一切平面都通过原点.

证明: 令 $f(x, y) = xe^{x/y}$ ($y \neq 0$). 它是一阶齐次函数, 故 Euler 公式给出

$$xf_x + yf_y = f.$$

曲面在任意点 $P_0 = (x_0, y_0, z_0)$ 的切平面为

$$z - z_0 = f_x(P_0)(x - x_0) + f_y(P_0)(y - y_0).$$

将原点代入, 右端为 $-[x_0 f_x(P_0) + y_0 f_y(P_0)] = -f(P_0) = -z_0$, 恰等于左端, 故每一切平面都通过原点。 $\square$

16. 求下列平面曲线在给定点的切线和法线方程 (1) $x^3y + xy^3 = 3 - x^2y^2$, 在点 (1,1);
(2) $\cos xy = x + 2y$, 在点 (1,0) .

解: (1)

$$\because F'_x = 3x^2y + y^3 + 2xy^2, \quad F'_y = x^3 + 3xy^2 + 2x^2y$$

$$\text{切线: } F'_x(x - x_0) + F'_y(y - y_0) = 0 \Leftrightarrow 6(x - 1) + 6(y - 1) = 0$$

$$\text{法线: } x - 1 = y - 1$$

(2)

$$\because F'_x = -y \sin(xy) - 1, \quad F'_y = -x \sin(xy) - 2$$

$$\text{切线: } -1(x - 1) - 2y = 0$$

$$\text{法线: } x - 1 = \frac{y}{2}$$

17. 求下列曲线在给定点的切线和法平面方程

$$(1) \begin{cases} y^2 + z^2 = 25, \\ x^2 + y^2 = 10 \end{cases} \quad \text{在点 } (1, 3, 4);$$

$$(2) \begin{cases} 2x^2 + 3y^2 + z^2 = 47, \\ x^2 + 2y^2 = z \end{cases} \quad \text{在点 } (-2, 1, 6) .$$

准备:

$$\text{grad } F(M_0) = F'_x(M_0) \mathbf{i} + F'_y(M_0) \mathbf{j} + F'_z(M_0) \mathbf{k}$$

$$\text{grad } G(M_0) = G'_x(M_0) \mathbf{i} + G'_y(M_0) \mathbf{j} + G'_z(M_0) \mathbf{k}$$

$$\text{切向量} \quad \mathbf{l} = \text{grad } F \times \text{grad } G = \frac{\partial(F, G)}{\partial(y, z)} \mathbf{i} + \frac{\partial(F, G)}{\partial(z, x)} \mathbf{j} + \frac{\partial(F, G)}{\partial(x, y)} \mathbf{k}$$

解: (1)

$$\therefore \begin{cases} F'_x = 0, & F'_y = 2y, & F'_z = 2z \\ G'_x = 2x, & G'_y = 2y, & G'_z = 0 \end{cases}$$

$$\text{切向量: } \mathbf{l} = (-48, 16, -12)$$

$$\text{切线: } \frac{x - 1}{-48} = \frac{y - 3}{16} = \frac{z - 4}{-12}$$

$$\text{法平面: } \Pi : 48(x - 1) - 16(y - 3) + 12(z - 4) = 0$$

(2)

$$\therefore \begin{cases} F'_x = 4x, & F'_y = 6y, & F'_z = 2z \\ G'_x = 2x, & G'_y = 4y, & G'_z = -1 \end{cases}$$

$$\text{切向量} \quad \mathbf{l} = (-54, -56, -8)$$

$$\text{切线} \quad \frac{x+2}{-54} = \frac{y-1}{-56} = \frac{z-6}{-8}$$

$$\text{法平面} \Pi : 54(x+2) + 56(y-1) + 8(z-6) = 0$$

18. 设方程组 $\begin{cases} pu + qv - t^2 = 0, \\ qu + pv - s^2 = 0 \end{cases} \quad (p^2 - q^2 \neq 0)$ 确定了隐函数 $\begin{cases} u = u(s, t), \\ v = v(s, t) \end{cases}$ 以
及反函数 $\begin{cases} s = s(u, v), \\ t = t(u, v). \end{cases}$ 求证:

$$\frac{\partial t}{\partial u} \cdot \frac{\partial u}{\partial t} = \frac{\partial s}{\partial v} \cdot \frac{\partial v}{\partial s} = \frac{p^2}{p^2 - q^2}$$

证明: 对 u, v, s, t 分别求偏导, 得到:

$$\begin{cases} p - 2t \frac{\partial t}{\partial u} = 0, \\ q - 2s \frac{\partial s}{\partial u} = 0 \end{cases} \begin{cases} q - 2t \frac{\partial t}{\partial v} = 0, \\ p - 2s \frac{\partial s}{\partial v} = 0 \end{cases} \begin{cases} p \frac{\partial u}{\partial s} + q \frac{\partial v}{\partial s} = 0, \\ q \frac{\partial u}{\partial s} + p \frac{\partial v}{\partial s} - 2s = 0 \end{cases} \begin{cases} p \frac{\partial u}{\partial t} + q \frac{\partial v}{\partial t} - 2t = 0, \\ q \frac{\partial u}{\partial t} + p \frac{\partial v}{\partial t} = 0 \end{cases}$$

可以得到:

$$\begin{aligned} \frac{\partial t}{\partial u} &= \frac{p}{2t}, \quad \frac{\partial u}{\partial t} = \frac{2pt}{p^2 - q^2}, \quad \frac{\partial s}{\partial v} = \frac{p}{2s}, \quad \frac{\partial v}{\partial s} = \frac{2ps}{p^2 - q^2} \\ \therefore \frac{\partial t}{\partial u} \cdot \frac{\partial u}{\partial t} &= \frac{\partial s}{\partial v} \cdot \frac{\partial v}{\partial s} = \frac{p^2}{p^2 - q^2} \end{aligned}$$

□

9.5 习题 多变量函数 Taylor 公式及极值

1. 求曲线 $F(t) = f(x+th, y+tk)$ 在 $t=1$ 处的斜率, 其中 (1) $f(x, y) = \sin(x^2 + y)$
 (2) $f(x, y) = x^2 + 2xy^2 - y^4$

解:

- (1) $F'(1) = hf_x(x+h, y+k) + kf_y(x+h, y+k) = [2h(x+h) + k] \cos((x+h)^2 + y+k),$
 (2) $F'(1) = h[2(x+h) + 2(y+k)^2] + k[4(x+h)(y+k) - 4(y+k)^3].$

2. 求下列函数由点 (x_0, y_0) 变到 (x_0+h, y_0+k) 时函数的增量. (1) $f(x, y) = x^3 + y^2 - 6xy - 39x + 18y + 4, (x_0, y_0) = (5, 6);$ (2) $f(x, y) = x^2y + xy^2 - 2xy, (x_0, y_0) = (1, -1)$

解:

- (1) $\Delta z = f(5+h, 6+k) - f(5, 6)$
 $= (5+h)^3 + (6+k)^2 - 6(5+h)(6+k) - 39(5+h) + 18(6+k) + 106$
 (2) $\Delta z = f(1+h, -1+k) - f(1, -1) = (h+1)(k-1)(h+k-2) - 2$

3. 对于函数 $f(x, y) = \sin \pi x + \cos \pi y$, 用中值定理证明, 存在一个数 $\theta, 0 < \theta < 1$ 使得

$$\frac{4}{\pi} = \cos \frac{\pi\theta}{2} + \sin \left[\frac{\pi}{2}(1-\theta) \right]$$

证明: 由二元函数的中值公式

$$f(x+h, y+k) - f(x, y) = hf'_x(x+\theta h, y+\theta k) + kf'_y(x+\theta h, y+\theta k)$$

$$\text{又有 } f'_x(x, y) = \pi \cos \pi x, \quad f'_y(x, y) = -\pi \sin \pi y$$

$$\text{取 } x=0, y=-\frac{1}{2}, h=k=\frac{1}{2}, \therefore f(x+h, y+k) - f(x, y) = 2$$

$$\begin{aligned} hf'_x + kf'_y &= \frac{1}{2}f'_x\left(\frac{\theta}{2}, \frac{\theta-1}{2}\right) + \frac{1}{2}f'_y\left(\frac{\theta}{2}, \frac{\theta-1}{2}\right) \\ &= \frac{\pi}{2} \cos \frac{\theta\pi}{2} - \frac{\pi}{2} \sin \frac{\pi(\theta-1)}{2} \Rightarrow \exists \theta, \quad s.t. \quad \frac{4}{\pi} = \cos \frac{\pi\theta}{2} + \sin \left[\frac{\pi}{2}(1-\theta) \right], \theta \in (0, 1) \end{aligned}$$

□

4. 求下列函数的 Taylor 公式, 并指出展开式成立的区域. (1) $f(x, y) = e^x \ln(1+y)$ 在点 $(0, 0)$, 直到三阶为止; (2) $f(x, y) = \sqrt{1-x^2-y^2}$ 在点 $(0, 0)$, 直到四阶为止; (3) $f(x, y) = \frac{1}{1-x-y+xy}$ 在点 $(0, 0)$, 直到 n 阶为止; (4) $\arctan \frac{1+x+y}{1-x+y}$ 在点 $(0, 0)$, 直到二阶为止; (5) $f(x, y) = \sin(x^2 + y^2)$ 在点 $(0, 0)$ 直到 n 阶为止; (6) $\frac{\cos x}{\cos y}$ 在点 $(0, 0)$ 展开到二阶为止; (7) $f(x, y) = 2x^2 - xy - y^2 - 6x - 3y + 5$ 在点 $(1, -2)$ 的 Taylor 展开式.

解:

$$\begin{aligned}
 (1) \quad f(x, y) &= e^x \ln(1+y) \\
 &= \left(1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+o(x^3)\right) \left(y-\frac{y^2}{2}+\frac{y^3}{3}+o(y^3)\right) \\
 &= y+xy-\frac{y^2}{2}+\frac{x^2y}{2}-\frac{xy^2}{2}+\frac{y^3}{3}+R_3, \quad |y|<1,
 \end{aligned}$$

$$\begin{aligned}
 (2) \quad f(x, y) &= \sqrt{1-x^2-y^2} \\
 &= 1+\frac{1}{2}(-x^2-y^2)-\frac{1}{8}(-x^2-y^2)^2+o(x^4+y^4) \\
 &= 1-\frac{1}{2}(x^2+y^2)-\frac{1}{8}(x^2+y^2)^2+R_4, \quad x^2+y^2<1,
 \end{aligned}$$

$$\begin{aligned}
 (3) \quad f(x, y) &= \frac{1}{(1-x)(1-y)} \\
 &= (1+x+x^2+x^3+\cdots)(1+y+y^2+y^3+\cdots) \\
 &= \sum_{m=0}^n \sum_{k=0}^m x^k y^{m-k} + R_n, \quad |x|<1, |y|<1,
 \end{aligned}$$

$$\begin{aligned}
 (4) \quad f(x, y) &= \arctan \frac{1+x+y}{1-x+y} = \arctan 1 + \arctan \left(\frac{x}{1+y} \right), \\
 &\because \left(\arctan \alpha + \arctan \beta = \arctan \frac{\alpha+\beta}{1-\alpha\beta} \right) \\
 f(x, y) &= \frac{\pi}{4} + x - xy + R_2
 \end{aligned}$$

$$(5) \quad f(x, y) = \sum_{k=0}^{k_i} \frac{(-1)^k (x^2+y^2)^{1+2k}}{(1+2k)!} + R_n, \quad (4k_i+2 \leq n)$$

$$\begin{aligned}
 (6) \quad &\because f(0,0)=1, \quad f'_x(0,0)=0, \quad f'_y(0,0)=0 \\
 &f''_{xx}(0,0)=-1, \quad f''_{yy}(0,0)=1, \quad f''_{xy}(0,0)=0 \\
 &\therefore \frac{\cos x}{\cos y} = 1 - \frac{1}{2}x^2 + \frac{1}{2}y^2 + R_2
 \end{aligned}$$

$$\begin{aligned}
 (7) \quad f(1, -2) &= 5, \quad f_x(1, -2) = f_y(1, -2) = 0, \\
 f_{xx} &= 4, \quad f_{xy} = -1, \quad f_{yy} = -2, \\
 \therefore f(x, y) &= 5 + 2(x-1)^2 - (x-1)(y+2) - (y+2)^2.
 \end{aligned}$$

5. 设 $z = z(x, y)$ 是由方程 $z^3 - 2xz + y = 0$ 所确定的隐函数, 当 $x = 1, y = 1$ 时 $z = 1$, 试按 $(x-1)$ 和 $(y-1)$ 的乘幂展开函数 z 至二次项为止.

解: 由二元函数 Taylor 公式, 展开到二次项形式为

$$\begin{aligned}
 f(x, y) &= f(x_0, y_0) + \frac{\partial f(x_0, y_0)}{\partial x} h + \frac{\partial f(x_0, y_0)}{\partial y} k + \frac{1}{2} (Ah^2 + 2Bhk + Ck^2) + R_2, \\
 A &= \frac{\partial^2 f(x_0, y_0)}{\partial x^2}, \quad B = \frac{\partial^2 f(x_0, y_0)}{\partial x \partial y}, \quad C = \frac{\partial^2 f(x_0, y_0)}{\partial y^2}.
 \end{aligned}$$

$$\begin{aligned} \because z(x_0, y_0) = 1, \quad z'_x &= \frac{2z}{3z^2 - 2x} = 2, z'_y = \frac{-1}{3z^2 - 2x} \\ z''_{xx} &= \frac{2z'_x(3z^2 - 2x) - (6zz'_x - 2)2z}{(3z^2 - 2x)^2} = -16, z''_{xy} = \frac{-(6zz'_x - 2)(-1)}{(3z^2 - 2x)^2} = 10, z''_{yy} = \frac{-(6zz'_y)(-1)}{(3z^2 - 2x)^2} = -6 \\ \therefore z(x, y) &= 1 + 2(x - 1) + (-1)(y - 1) - 8(x - 1)^2 + 10(x - 1)(y - 1) - 3(y - 1)^2 + R_2 \end{aligned}$$

6. 证明, 球面三角学中的余弦定理

$$\cos z = \cos x \cos y + \sin x \sin y \cos \theta$$

在原点的邻域内转化为欧几里得几何中的余弦定理

$$z^2 = x^2 + y^2 - 2xy \cos \theta$$

证明: $\cos z = \cos x \cos y + \sin x \sin y \cos \theta$ 由二元函数 Taylor 公式得到

$$\begin{aligned} 1 - \frac{z^2}{2} + o(z^2) &= 1 - \frac{x^2}{2} - \frac{y^2}{2} + o(x^2 + y^2) + xy \cos \theta \\ \Rightarrow z^2 &= x^2 + y^2 - 2xy \cos \theta \end{aligned}$$

□

7. 求下列函数的极值. (1) $f(x, y) = xy + \frac{50}{x} + \frac{20}{y}$ ($x > 0, y > 0$) (2) $f(x, y) = 4(x - y) - x^2 - y^2$ (3) $f(x, y) = e^{2x}(x + 2y + y^2)$ (4) $(x^2 + y^2)^2 = a^2(x^2 - y^2)$, 求隐函数 $y = y(x)$ 的极值. (5) $x^2 + y^2 + z^2 - 2x + 2y - 4z - 10 = 0$, 求隐函数 $z = z(x, y)$ 的极值.

解: (1)

$$\begin{aligned} f(x, y) &= xy + \frac{50}{x} + \frac{20}{y} \quad (x > 0, y > 0) \\ &\geq 3\sqrt[3]{xy \cdot \frac{50}{x} \cdot \frac{20}{y}} = 30. \end{aligned}$$

当 $xy = 50/x = 20/y$, 即 $x = 5, y = 2$ 时取等号, 故极小值为 30. (2) $f(x, y) = 4(x - y) - x^2 - y^2$,

$$\begin{cases} f'_x = 4 - 2x = 0 \\ f'_y = -4 - 2y = 0 \end{cases} \Rightarrow \begin{cases} x = 2 \\ y = -2 \end{cases}$$

$$\text{再求导得到二阶导: } \begin{cases} A = f''_{xx} = -2 \\ B = f''_{xy} = 0 \\ C = f''_{yy} = -2 \end{cases} \quad \Delta = AC - B^2 = 4 > 0, A < 0 \therefore f(x, y)_{\max} = 16 - 8 = 8$$

(3)

$$\begin{cases} f'_x = 2e^{2x}(x + 2y + y^2) + e^{2x} = 0 \\ f'_y = e^{2x}(2 + 2y) = 0 \end{cases} \Rightarrow \begin{cases} x = \frac{1}{2} \\ y = -1 \end{cases}$$

$$\begin{cases} A = f''_{xx} = 4e^{2x} + 4xe^{2x} + 4(2y + y^2)e^{2x} = 2e \\ B = f''_{xy} = 2(2 + 2y)e^{2x} = 0 \\ C = f''_{yy} = 2e^{2x} = 2e \end{cases}, \Delta = AC - B^2 > 0, A > 0,$$

$$\therefore f(x, y)_{\min} = f\left(\frac{1}{2}, -1\right) = -\frac{e}{2}$$

(4) 设 $a > 0$. 在曲线上求 y 的非零极值点时 $y' = 0$, 故

$$x^2 + y^2 = \frac{a^2}{2}, \quad x^2 - y^2 = \frac{a^2}{4}.$$

因此 $x^2 = 3a^2/8, y^2 = a^2/8$. 隐函数的极大值为 $a/(2\sqrt{2})$, 在 $x = \pm a\sqrt{3/8}$ 处取得; 极小值为 $-a/(2\sqrt{2})$, 也在 $x = \pm a\sqrt{3/8}$ 处取得.

(5) 化简得到

$$(x-1)^2 + (y+1)^2 + (z-2)^2 = 16.$$

故 z 的极大值为 6, 在 $(1, -1, 6)$ 处取得; 极小值为 -2, 在 $(1, -1, -2)$ 处取得.

★ 关于隐函数确定的函数的 $\frac{dy}{dx}, \frac{d^2y}{dx^2}$

$$\begin{aligned} \frac{dy}{dx} &= y'(x) = -\frac{F'_x}{F'_y} \\ \frac{d^2y}{dx^2} &= y''(x) = -\left(\frac{F'_x(x, y)}{F'_y(x, y)}\right)'_x = -\frac{(F'_x(x, y))'_x F'_y - (F'_y(x, y))'_x F'_x}{(F'_y)^2} \\ &= -\frac{(F''_{xx} + F''_{xy}y'_x) F'_y - (F''_{yx} + y'_x F''_{yy}) F'_x}{(F'_y)^2} \\ &= -\frac{(F''_{xx}F'_y - F''_{xy}F'_x) F'_y - (F''_{yx}F'_y - F'_x F''_{yy}) F'_x}{(F'_y)^3} \\ &= \frac{2F_{xy}''F'_x F'_y - F_{xx}''(F'_y)^2 - F_{yy}''(F'_x)^2}{(F'_y)^3} \end{aligned}$$

8. 求一个三角形, 使得它的三个角的正弦乘积最大.

解: 因 $\log \sin x$ 在 $(0, \pi)$ 上是严格凹函数, 由 Jensen 不等式,

$$\frac{\log \sin A + \log \sin B + \log \sin C}{3} \leq \log \sin \frac{A+B+C}{3} = \log \frac{\sqrt{3}}{2}.$$

所以 $\sin A \sin B \sin C \leq 3\sqrt{3}/8$, 且仅当 $A = B = C = \pi/3$ (等边三角形) 时取等号.

9. 例 9.5.5 中已经给出了在约束条件 $(x-1)^2 + y^2 - 1 = 0$ 下 $z = xy$ 的极值, 请画出 $z = xy$ 的等值线簇与曲线 (圆) $(x-1)^2 + y^2 - 1 = 0$ 相交的情况, 并标出极值点的位置的示意图.

10. 求下列函数在指定条件下的极值 (1) $u = x^2 + y^2$, 若 $\frac{x}{a} + \frac{y}{b} = 1$; (2) $u = x + y + z$, 若 $\frac{1}{x} + \frac{1}{y} + \frac{1}{z} = 1, x > 0, y > 0, z > 0$; (3) $u = \sin x \sin y \sin z$, 若 $x + y + z = \frac{\pi}{2}, x > 0, y > 0, z > 0$; (4) $u = xyz$, 若 $x + y + z = 0$ 且 $x^2 + y^2 + z^2 = 1$.

解: (1) $f(x, y, \lambda) = (x^2 + y^2) + \lambda \left(\frac{x}{a} + \frac{y}{b} - 1 \right)$

$$\begin{cases} f'_x = 2x - \frac{\lambda}{a} = 0 \\ f'_y = 2y - \frac{\lambda}{b} = 0 \\ f'_\lambda = \frac{x}{a} + \frac{y}{b} - 1 = 0 \end{cases} \Rightarrow \begin{cases} x = \frac{ab^2}{a^2+b^2} \\ y = \frac{a^2b}{a^2+b^2} \end{cases}, \Delta > 0$$

此时有极小值 $u_{\min} = \frac{a^2b^2}{a^2+b^2}$.

(2) $f(x, y, z, \lambda) = (x + y + z) + \lambda \left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z} - 1 \right)$

$$\begin{cases} f'_x = 1 + \frac{\lambda}{x^2} = 0 \\ f'_y = 1 + \frac{\lambda}{y^2} = 0 \\ f'_z = 1 + \frac{\lambda}{z^2} = 0 \\ f'_\lambda = \frac{1}{x} + \frac{1}{y} + \frac{1}{z} - 1 = 0 \end{cases} \Rightarrow \begin{cases} x = y = z = 3 \\ \Delta > 0 \end{cases}$$

此时有极小值 $u_{\min} = 9$

(3)

$$f(x, y, z, \lambda) = \sin x \sin y \sin z + \lambda \left(x + y + z - \frac{\pi}{2} \right)$$

$$\begin{cases} f'_x = \cos x \sin y \sin z - \lambda = 0 \\ f'_y = \sin x \cos y \sin z - \lambda = 0 \\ f'_z = \sin x \sin y \cos z - \lambda = 0 \\ f'_\lambda = x + y + z - \frac{\pi}{2} = 0 \end{cases} \Rightarrow \begin{cases} x = y = z = \frac{\pi}{6} \\ \Delta < 0 \end{cases}$$

此时有极大值 $u_{\max} = \frac{1}{8}$

(4) 由 $x + y + z = 0$ 得 $xy + yz + zx = -1/2$ 。极值点有两个变量相等，联立两约束可得（连同坐标的任意排列）

$$\left(-\frac{1}{\sqrt{6}}, -\frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}} \right), \quad \left(\frac{1}{\sqrt{6}}, \frac{1}{\sqrt{6}}, -\frac{2}{\sqrt{6}} \right).$$

因此 $u_{\max} = 1/(3\sqrt{6}) = \sqrt{6}/18$, $u_{\min} = -\sqrt{6}/18$ 。

11. 求下列函数在指定范围内的最大值与最小值. (1) $z = x^2 - y^2, \{(x, y) \mid x^2 + y^2 \leq 4\}$
 (2) $z = x^2 - xy + y^2, \{(x, y) \mid |x| + |y| \leq 1\}$; (3) $z = \sin x + \sin y - \sin(x + y), \{(x, y) \mid x \geq 0, y \geq 0, x + y \leq 2\pi\}$; (4) $z = x^2 y(4 - x - y), \{(x, y) \mid x \geq 0, y \geq 0, x + y \leq 6\}$.

解: (1) 解方程组 $\begin{cases} z'_x = 2x = 0, \\ z'_y = -2y = 0, \end{cases}$ 得驻点 $(0, 0)$. 由于 $z''_{xx} = 2, z''_{xy} = 0, z''_{yy} = -2, \Delta = -4 < 0$, 所以 $(0, 0)$ 不是极值点.

在边界 $x^2 + y^2 = 4$ 上, $z = 2x^2 - 4$, 由 $z'_x = 4x = 0$ 得驻点 $x = 0, y = \pm 2$, 在点 $(0, 2)$, $(0, -2)$ 上, $z(0, 2) = z(0, -2) = -4$,

以及在边界点 $(2, 0)$ 和 $(-2, 0)$ 上, $z(2, 0) = z(-2, 0) = 4$, 比较各点的函数值知, 在点 $(2, 0), (-2, 0)$ 函数取最大值 4, 在点 $(0, 2), (0, -2)$ 函数取最小值 -4.

(2) 解方程组 $\begin{cases} z'_x = 2x - y = 0, \\ z'_y = -x + 2y = 0, \end{cases}$ 得驻点 $(0, 0)$, 函数值 $z(0, 0) = 0$. 考察边界上相应一元函数的驻点及其函数值有:

$$z|_{x+y=1} = 1 - 3x(1-x), z'_x = -3(1-2x) = 0 \quad \text{得 } x = \frac{1}{2}, y = \frac{1}{2}, z\left(\frac{1}{2}, \frac{1}{2}\right) = \frac{1}{4}.$$

$$z|_{x-y=1} = 1 + x(x-1), z'_x = 2x-1 = 0, \quad \text{得 } x = \frac{1}{2}, y = -\frac{1}{2}, z\left(\frac{1}{2}, -\frac{1}{2}\right) = \frac{3}{4}.$$

$$z|_{x+y=-1} = 1 + 3x(x+1), z'_x = 3(2x+1) = 0, \quad \text{得 } x = -\frac{1}{2}, y = -\frac{1}{2}, z\left(-\frac{1}{2}, -\frac{1}{2}\right) = \frac{1}{4}.$$

$$z|_{y-x=-1} = 1 + x(x+1), z'_x = 2x+1 = 0, \quad \text{得 } x = -\frac{1}{2}, y = \frac{1}{2}, z\left(-\frac{1}{2}, \frac{1}{2}\right) = \frac{3}{4}.$$

而边界点 $(1, 0), (0, 1), (-1, 0), (0, -1)$ 的函数值都等于 1, 所以函数的最大值点为 $(1, 0), (0, 1), (-1, 0), (0, -1)$, 最大值为 1, 函数的最小值点为 $(0, 0)$, 最小值为 0.

$$(3) \text{ 解方程组 } \begin{cases} z'_x = \cos x - \cos(x+y) = 0, \\ z'_y = \cos y - \cos(x+y) = 0, \end{cases} \quad \text{得 } \cos x = \cos y,$$

因此驻点在 $x = y$ 或 $x + y = 2\pi$ 上, 在区域内部仅 $\left(\frac{2\pi}{3}, \frac{2\pi}{3}\right)$ 为驻点, $z\left(\frac{2\pi}{3}, \frac{2\pi}{3}\right) = \frac{3\sqrt{3}}{2}$.

而在边界 $x = 0, 0 \leq y \leq 2\pi; y = 0, 0 \leq x \leq 2\pi; x + y = 2\pi$ 上函数值均为零,

所以函数在点 $\left(\frac{2\pi}{3}, \frac{2\pi}{3}\right)$ 取得最大值 $\frac{3\sqrt{3}}{2}$, 在边界上取得最小值为 0.

$$(4) \text{ 解方程组 } \begin{cases} z'_x = 2xy(4-x-y) + x^2y(-1) = 0 \\ z'_y = x^2(4-x-y) + x^2y(-1) = 0 \end{cases} \text{ 得 } x = 2y,$$

因此驻点为 $(0, 0), (2, 1)$, $z(0, 0) = 0, z(2, 1) = 4$.

而在边界 $x \geq 0, y \geq 0$ 上函数值均为零, 在 $x + y = 6$ 边界 $z|_{x+y=6} = 2x^2(x-6) \geq -64$

所以函数在点 $(2, 1)$ 取得最大值 4, 在 $x + y = 6$ 边界取得最小值为 -64.

12. 在平面 $3x - 2z = 0$ 上求一点, 使它与点 $A(1, 1, 1)$ 和 $B(2, 3, 4)$ 的距离平方和最小.

解: 平面 $3x - 2z = 0$ 是一个过 y 轴的平面, 且计算可得两点分别在平面两侧. 设满足条件的点坐标为 $(x, y, \frac{3x}{2})$, 若使所求最小, 则有 $y = \frac{1+3}{2} = 2$ 两点距离平方和为

$$\begin{aligned} & (x-1)^2 + (2-1)^2 + \left(\frac{3x}{2}-1\right)^2 + (x-2)^2 + (2-3)^2 + \left(\frac{3x}{2}-4\right)^2 \\ &= \frac{13x^2}{2} - 21x + 24 = \frac{13\left(x - \frac{21}{13}\right)^2}{2} + \frac{183}{26} \geq \frac{183}{26} \end{aligned}$$

所以所求点为 $\left(\frac{21}{13}, 2, \frac{63}{26}\right)$.

13. 在曲线 $\begin{cases} z = x^2 + 2y^2 \\ z = 6 - 2x^2 - y^2 \end{cases}$ 上, 求竖坐标分别为最大值和最小值的点.

解: 联立方程得到 $x^2 + y^2 = 2$, 代回得到 $z = 2 + y^2$, z 最大 4, 最小 2, 最大值点为 $(0, \pm\sqrt{2}, 4)$, 最小值点为 $(\pm\sqrt{2}, 0, 2)$.

14. 设 $f(x, y) = 3x^2y - x^4 - 2y^2$. 证明: $(0, 0)$ 不是它的极值点, 但沿过 $(0, 0)$ 点的每条直线, $(0, 0)$ 都是它的极大值点.

证明: (1) 由

$$\begin{cases} f'_x = 6xy - 4x^3 = 0 \\ f'_y = 3x^2 - 4y = 0 \end{cases} \text{ 解得 } \begin{cases} x = 0 \\ y = 0 \end{cases}$$

又由

$$\begin{aligned} & f''_{xx} = 6y - 12x^2, \quad f''_{xy} = 6x, \quad f''_{yy} = -4 \\ & H[f(0, 0)] = \begin{bmatrix} 0 & 0 \\ 0 & -4 \end{bmatrix}, \Delta = \begin{vmatrix} 0 & 0 \\ 0 & -4 \end{vmatrix} = 0, \end{aligned}$$

Hessian 判别法在此不能判定. 直接取 $y = 0$, 有 $f(x, 0) = -x^4 < 0$; 取 $y = 3x^2/4$, 有 $f(x, 3x^2/4) = x^4/8 > 0$ ($x \neq 0$). 故原点任意邻域内都有正、负函数值, $(0, 0)$ 不是极值点.

(2) 考虑直线 $y = kx$,

$$\begin{aligned} f(x, kx) &= 3kx^3 - x^4 - 2k^2x^2 \\ &= x^2(3kx - x^2 - 2k^2) \end{aligned}$$

$k \neq 0$ 时, 只要 x 充分小有 $f(x, kx) \leq 0$.

$k = 0$ 时, $f(x, 0) = -x^4 \leq 0$

这说明直线 $y = kx$ 上考虑时, 函数在 $(0, 0)$ 点有极大值. □

15. 一帐篷, 下部为圆柱形, 上部盖以圆锥形的顶篷, 设帐篷的容积为一定数 V_0 . 试证当 $R = \sqrt{5}H, h = 2H$ 时, (其中 R, H 各为圆柱形的底半径和高, h 为圆锥形的高) 所用篷布最省.

解: 帐篷的体积 $V = \pi R^2 H + \frac{1}{3} \pi R^2 h = V_0$, 篷布的面积 $S = 2\pi RH + \frac{1}{2} \cdot 2\pi R \cdot \sqrt{h^2 + R^2}$, 在 $\pi R^2 H + \frac{1}{3} \pi R^2 h = V_0$ 的条件下, S 取得极小值的必要条件如下: 设 Lagrange 辅助函数

$$F(R, H, h, \lambda) = 2\pi RH + \pi R \sqrt{h^2 + R^2} + \lambda \left(\pi R^2 H + \frac{1}{3} \pi R^2 h - V_0 \right)$$

$$\text{令} \begin{cases} F'_R = 2\pi H + \pi \sqrt{h^2 + R^2} + \frac{\pi R^2}{\sqrt{h^2 + R^2}} + \lambda \left(2\pi RH + \frac{2}{3} \pi R h \right) = 0 \\ F'_H = 2\pi R + \lambda \pi R^2 = 0, \\ F'_h = \frac{\pi R h}{\sqrt{h^2 + R^2}} + \frac{1}{3} \pi R^2 \lambda = 0 \\ F'_\lambda = \pi R^2 H + \frac{1}{3} \pi R^2 h - V_0 = 0 \end{cases}$$

计算得, 篷布最少时, 帐篷尺度间的关系式为 $R = \sqrt{5}H, h = 2H$. □

16. 已知平行六面体所有各棱长之和为 $12a$, 求其最大体积.

解: $\because 4(x + y + z) = 12a$. 由混合积的几何意义,

$$V \leq xyz \leq \left(\frac{x + y + z}{3} \right)^3 = a^3.$$

当三条相邻棱两两垂直且 $x = y = z = a$ 时同时取等号, 故最大体积为 a^3 .

17. 在椭圆 $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ 上求一点 $M(x, y) (x, y \geq 0)$, 使椭圆在该点的切线与坐标轴构成的三角形面积为最小, 并求其面积.

解:

$$S = \frac{a^2 b^2}{2x_0 y_0} = \frac{\frac{1}{2} ab}{\frac{x_0}{a} \cdot \frac{y_0}{b}} \geq \frac{\frac{1}{2} ab}{\frac{1}{2} \left(\frac{x_0^2}{a^2} + \frac{y_0^2}{b^2} \right)} = ab,$$

$$\text{当仅当 } \frac{x_0}{a} = \frac{y_0}{b} = \frac{\sqrt{2}}{2}, \text{ 最小面积为 } ab$$

18. 求平面上一点 (x_0, y_0) , 使其到 n 个定点 $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ 的距离的平方和最小.

解: 设所求点为 (x, y) , 距离的平方和为 $\sum_{i=1}^n ((x - x_i)^2 + (y - y_i)^2)$ 直接记作 Lagrange 辅助函数

$$\because F'_x = \sum_{i=1}^n 2(x - x_i) = 0, \quad F'_y = \sum_{i=1}^n 2(y - y_i) = 0$$

的时候取极值, 且是极小值, 于是解得所求点的坐标为 $\left(\frac{x_1 + x_2 + \cdots + x_n}{n}, \frac{y_1 + y_2 + \cdots + y_n}{n}\right)$

20. 在旋转椭球面 $\frac{x^2}{4} + y^2 + z^2 = 1$ 上求距平面 $x + y + 2z = 9$ 最远和最近的点.

解: 设 (x, y, z) 为椭球面上的任意一点, 则该点到平面的距离 $d = \frac{|x + y + 2z - 9|}{\sqrt{1^2 + 1^2 + (-2)^2}} = \frac{1}{\sqrt{6}}|x + y + 2z - 9|$
记 Lagrange 辅助函数

$$F = (\sqrt{6}d)^2 + \lambda(x^2 + 4y^2 + 4z^2 - 4) = (x + y + 2z - 9)^2 + \lambda(x^2 + 4y^2 + 4z^2 - 4)$$

可以得到方程组

$$F'_x = 2(x + y + 2z - 9) + 2\lambda x = 0$$

$$F'_y = 2(x + y + 2z - 9) + 8\lambda y = 0$$

$$F'_z = 4(x + y + 2z - 9) + 8\lambda z = 0$$

$$F'_\lambda = x^2 + 4y^2 + 4z^2 - 4 = 0$$

得驻点 $\left(\frac{4}{3}, \frac{1}{3}, \frac{2}{3}\right)$ 和 $\left(-\frac{4}{3}, -\frac{1}{3}, -\frac{2}{3}\right)$.

$$\because d\left(\frac{4}{3}, \frac{1}{3}, \frac{2}{3}\right) = \sqrt{6}, \quad d\left(-\frac{4}{3}, -\frac{1}{3}, -\frac{2}{3}\right) = 2\sqrt{6}$$

所以 $\left(\frac{4}{3}, \frac{1}{3}, \frac{2}{3}\right)$ 为最近点, $\left(-\frac{4}{3}, -\frac{1}{3}, -\frac{2}{3}\right)$ 为最远点.

21. 设曲面 $S: \sqrt{x} + \sqrt{y} + \sqrt{z} = \sqrt{a} (a > 0)$ (1) 证明 S 上任意点处的切平面与各坐标轴的截距之和等于 a . (2) 在 S 上求一切平面, 使此切平面与三坐标面所围成的四面体体积最大, 并求四面体体积的最大值.

证明 (1) 设 $F(x, y, z) = \sqrt{x} + \sqrt{y} + \sqrt{z} - \sqrt{a}$ 则

$$F'_x = \frac{1}{2\sqrt{x}}, F'_y = \frac{1}{2\sqrt{y}}, F'_z = \frac{1}{2\sqrt{z}}$$

所以曲面 $\sqrt{x} + \sqrt{y} + \sqrt{z} = \sqrt{a} (a > 0)$ 上任意点 (x_0, y_0, z_0) 处的切平面为:

$$\frac{1}{\sqrt{x_0}}(x - x_0) + \frac{1}{\sqrt{y_0}}(y - y_0) + \frac{1}{\sqrt{z_0}}(z - z_0) = 0$$

$$\because \sqrt{x_0} + \sqrt{y_0} + \sqrt{z_0} = \sqrt{a}$$

所以切平面在各坐标轴上的截距之和为: $\sqrt{a} \cdot \sqrt{x_0} + \sqrt{a} \cdot \sqrt{y_0} + \sqrt{a} \cdot \sqrt{z_0} = \sqrt{a} \cdot \sqrt{a} = a$ $\square$

$$\text{解: (2) } V = \frac{1}{3}Sh = \frac{1}{6}\sqrt{ax_0 \cdot ay_0 \cdot az_0} \leq \frac{1}{6}\left(\frac{\sqrt{ax_0} + \sqrt{ay_0} + \sqrt{az_0}}{3}\right)^3 = \frac{a^3}{162}$$

$x_0 = y_0 = z_0 = \frac{a}{9}$ 时取等号, 四面体体积的最大值为 $\frac{a^3}{162}$.

9.6 习题 向量场的微商

1. 求电场强度 $\mathbf{E} = \frac{q}{r^3} \mathbf{r}$ ($r = |\mathbf{r}|$) 的散度和旋度.

解:

$$\begin{aligned}\nabla \cdot \mathbf{E} &= q \left(\frac{3}{r^3} - \frac{3(x^2 + y^2 + z^2)}{r^5} \right) = 0 \quad (r \neq 0), \\ \nabla \times \mathbf{E} &= \left(\frac{\partial E_z}{\partial y} - \frac{\partial E_y}{\partial z} \right) \mathbf{i} + \left(\frac{\partial E_x}{\partial z} - \frac{\partial E_z}{\partial x} \right) \mathbf{j} + \left(\frac{\partial E_y}{\partial x} - \frac{\partial E_x}{\partial y} \right) \mathbf{k} = \mathbf{0}\end{aligned}$$

2. 设 $\boldsymbol{\omega} = \omega_1 \mathbf{i} + \omega_2 \mathbf{j} + \omega_3 \mathbf{k}$ 是一个常值向量, 求向量场 $\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r}$ 的旋度 $\nabla \times \mathbf{v}$, 并给出合理的物理解释. 这里 $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ 是位置向量.

解:

$$\begin{aligned}\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_1 & \omega_2 & \omega_3 \\ x & y & z \end{vmatrix} = (\omega_2 z - \omega_3 y) \mathbf{i} + (\omega_3 x - \omega_1 z) \mathbf{j} + (\omega_1 y - \omega_2 x) \mathbf{k} \\ \nabla \times \mathbf{v} &= 2\boldsymbol{\omega}.\end{aligned}$$

这是绕轴作角速度为 $\boldsymbol{\omega}$ 的刚体转动; 其涡量为 $2\boldsymbol{\omega}$.

3. 求下列向量场在指定点的散度 (1) $\mathbf{v} = (3x^2 - 2yz, y^3 + yz^2, xyz - 3xz^2)$ 在 $M(1, -2, 2)$ 处; (2) $\mathbf{v} = x^2 \sin y \mathbf{i} + y^2 \sin(xz) \mathbf{j} + xy \sin(\cos z) \mathbf{k}$ 在 $M(x, y, z)$ 处.

解:

$$\begin{aligned}\nabla \cdot \mathbf{v}_1 &= 6x + 3y^2 + z^2 + xy - 6xz = 8 \\ \nabla \cdot \mathbf{v}_2 &= 2x \sin y + 2y \sin(xz) + xy(-\sin z) \cos(\cos z)\end{aligned}$$

4. 设 $\mathbf{w}$ 是常向量, $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $r = |\mathbf{r}|$, 求 (1) $\operatorname{div}[(\mathbf{r} \cdot \mathbf{w})\mathbf{w}]$; (2) $\operatorname{div} \frac{\mathbf{r}}{r}$ (3) $\operatorname{div}(\mathbf{w} \times \mathbf{r})$ (4) $\operatorname{div}(r^2 \mathbf{w})$

解: 设常向量 $\boldsymbol{\omega} = \omega_1 \mathbf{i} + \omega_2 \mathbf{j} + \omega_3 \mathbf{k}$,

$$\begin{aligned}\operatorname{div}[(\mathbf{r} \cdot \mathbf{w})\mathbf{w}] &= \mathbf{w} \cdot \nabla(\mathbf{r} \cdot \mathbf{w}) = |\mathbf{w}|^2, \\ \operatorname{div} \frac{\mathbf{r}}{r} &= \left(\frac{x}{r} \right)'_x + \left(\frac{y}{r} \right)'_y + \left(\frac{z}{r} \right)'_z = \frac{3}{r} - \frac{x^2 + y^2 + z^2}{r^3} = \frac{2}{r} \\ \operatorname{div}(\mathbf{w} \times \mathbf{r}) &= 0, \\ \operatorname{div}(r^2 \mathbf{w}) &= \operatorname{div}[(x^2 + y^2 + z^2)\boldsymbol{\omega}] = 2(\omega_1 x + \omega_2 y + \omega_3 z) = 2\boldsymbol{\omega} \cdot \mathbf{r}\end{aligned}$$

5. 求下列向量场的旋度. (1) $\mathbf{v} = y^2 \mathbf{i} + z^2 \mathbf{j} + x^2 \mathbf{k}$ (2) $\mathbf{v} = (xe^y + y) \mathbf{i} + (z + e^y) \mathbf{j} + (y + 2ze^y) \mathbf{k}$.

解:

$$\nabla \times \mathbf{v}_1 = (-2z, -2x, -2y), \quad \nabla \times \mathbf{v}_2 = (2ze^y, 0, -xe^y - 1).$$

6. 设 $\mathbf{w}$ 是常向量, $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $r = |\mathbf{r}|$, 求: (1) $\text{rot}(\mathbf{w} \times \mathbf{r})$; (2) $\text{rot}[f(r)\mathbf{r}]$ (3) $\text{rot}[f(r)\mathbf{w}]$; (4) $\text{div}[\mathbf{r} \times f(r)\mathbf{w}]$

解: 设常向量 $\mathbf{w} = \omega_1\mathbf{i} + \omega_2\mathbf{j} + \omega_3\mathbf{k}$,

$$\text{rot}(\mathbf{w} \times \mathbf{r}) = 2\mathbf{w},$$

$$\text{rot}[f(r)\mathbf{r}] = \mathbf{0},$$

$$\text{rot}[f(r)\mathbf{w}] = \frac{f'(r)}{r}(\mathbf{r} \times \mathbf{w}),$$

$$\text{div}[\mathbf{r} \times f(r)\mathbf{w}] = 0.$$

7. 设 $\mathbf{w}$ 是常向量, $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $r = |\mathbf{r}|$, $f(r)$ 是 r 的可微函数, 试通过 ∇ 运算求: (1) $\nabla(\mathbf{w} \cdot f(r)\mathbf{r})$; (2) $\nabla \cdot (\mathbf{w} \times f(r)\mathbf{r})$; (3) $\nabla \times (\mathbf{w} \times f(r)\mathbf{r})$.

解:

$$\nabla[\mathbf{w} \cdot f(r)\mathbf{r}] = f(r)\mathbf{w} + \frac{f'(r)}{r}(\mathbf{w} \cdot \mathbf{r})\mathbf{r},$$

$$\nabla \cdot [\mathbf{w} \times f(r)\mathbf{r}] = 0,$$

$$\nabla \times [\mathbf{w} \times f(r)\mathbf{r}] = (2f(r) + rf'(r))\mathbf{w} - \frac{f'(r)}{r}(\mathbf{w} \cdot \mathbf{r})\mathbf{r}.$$

8. 设 ϕ, ψ 是数量场, $\mathbf{a}, \mathbf{b}$ 为向量场, 证明

$$\nabla(\phi + \psi) = \nabla\phi + \nabla\psi \quad (1)$$

$$\nabla \cdot (\mathbf{a} + \mathbf{b}) = \nabla \cdot \mathbf{a} + \nabla \cdot \mathbf{b} \quad (2)$$

$$\nabla \times (\mathbf{a} + \mathbf{b}) = \nabla \times \mathbf{a} + \nabla \times \mathbf{b} \quad (3)$$

$$\nabla(\phi\psi) = \phi\nabla\psi + \psi\nabla\phi \quad (4)$$

$$\nabla \cdot (\phi\mathbf{a}) = \phi\nabla \cdot \mathbf{a} + \mathbf{a} \cdot \nabla\phi \quad (5)$$

$$\nabla \cdot (\mathbf{a} \times \mathbf{b}) = \mathbf{b} \cdot \nabla \times \mathbf{a} - \mathbf{a} \cdot \nabla \times \mathbf{b} \quad (6)$$

$$\nabla \times (\phi\mathbf{a}) = \nabla\phi \times \mathbf{a} + \phi\nabla \times \mathbf{a} \quad (7)$$

证明: 通过代入 Hamilton 算符证明, 其中 1~3 式为线性性质, 可简易说明, 下面证明 4~7 式: 4 式: 相当于函数乘积求导法则;

5 式:

$$\begin{aligned}\text{LHS} &= \nabla \cdot (\phi \mathbf{a}) = \nabla \cdot (\phi a_x, \phi a_y, \phi a_z) = \frac{\partial(\phi a_x)}{\partial x} + \frac{\partial(\phi a_y)}{\partial y} + \frac{\partial(\phi a_z)}{\partial z} \\ \text{RHS} &= \nabla \phi \cdot \mathbf{a} + \phi(\nabla \cdot \mathbf{a}) = \left(\frac{\partial \phi}{\partial x}, \frac{\partial \phi}{\partial y}, \frac{\partial \phi}{\partial z} \right) \cdot (a_x, a_y, a_z) + \phi \left(\frac{\partial a_x}{\partial x} + \frac{\partial a_y}{\partial y} + \frac{\partial a_z}{\partial z} \right) \\ &\therefore \text{LHS} = \text{RHS}\end{aligned}$$

6 式: 将 $\mathbf{a} = (a_1, a_2, a_3)$ 、 $\mathbf{b} = (b_1, b_2, b_3)$ 代入左式, 逐项使用乘积求导法则并重新分组, 使得

$$\nabla \cdot (\mathbf{a} \times \mathbf{b}) = \mathbf{b} \cdot (\nabla \times \mathbf{a}) - \mathbf{a} \cdot (\nabla \times \mathbf{b}).$$

7 式: 将 $\nabla \times (\phi \mathbf{a})$ 的三个分量逐项展开, 例如第一分量为

$$\frac{\partial(\phi a_3)}{\partial y} - \frac{\partial(\phi a_2)}{\partial z} = \phi_y a_3 - \phi_z a_2 + \phi(a_{3y} - a_{2z}),$$

其余两分量同理, 故 $\nabla \times (\phi \mathbf{a}) = \nabla \phi \times \mathbf{a} + \phi \nabla \times \mathbf{a}$. □

9. 证明

$$\begin{aligned}\text{rot grad } \phi &= \nabla \times \nabla \phi = \mathbf{0} \\ \text{div rot } \mathbf{a} &= \nabla \cdot (\nabla \times \mathbf{a}) = 0\end{aligned}$$

证明: (1)

$$\begin{aligned}\nabla \phi &= \text{grad } \phi = \frac{\partial \phi}{\partial x} \mathbf{i} + \frac{\partial \phi}{\partial y} \mathbf{j} + \frac{\partial \phi}{\partial z} \mathbf{k} = \phi'_x \mathbf{i} + \phi'_y \mathbf{j} + \phi'_z \mathbf{k} \\ \text{rot grad } \phi &= \nabla \times \nabla \phi = \left(\frac{\partial \phi'_z}{\partial y} - \frac{\partial \phi'_y}{\partial z} \right) \mathbf{i} + \left(\frac{\partial \phi'_x}{\partial z} - \frac{\partial \phi'_z}{\partial x} \right) \mathbf{j} + \left(\frac{\partial \phi'_y}{\partial x} - \frac{\partial \phi'_x}{\partial y} \right) \mathbf{k} = \mathbf{0}\end{aligned}$$

(2)

设 $\mathbf{a}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$

$$\begin{aligned}\text{rot } \mathbf{a} &= \nabla \times \mathbf{a} \\ &= \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \mathbf{i} + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) \mathbf{j} + \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \mathbf{k} \\ \text{div rot } \mathbf{a} &= \nabla \cdot (\nabla \times \mathbf{a}) = \frac{\partial}{\partial x} \left(\frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) + \frac{\partial}{\partial y} \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x} \right) + \frac{\partial}{\partial z} \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \\ &= 0\end{aligned}$$

□

10. 证明

$$\nabla \times (\nabla \times \mathbf{v}) = \nabla(\nabla \cdot \mathbf{v}) - \nabla^2 \mathbf{v}$$

证明：用 Levi-Civita 记号及恒等式 $\varepsilon_{ijk}\varepsilon_{klm} = \delta_{il}\delta_{jm} - \delta_{im}\delta_{jl}$ ，有

$$\begin{aligned} [\nabla \times (\nabla \times \mathbf{v})]_i &= \varepsilon_{ijk} \partial_j (\varepsilon_{klm} \partial_l v_m) \\ &= \partial_i (\partial_m v_m) - \partial_j \partial_j v_i. \end{aligned}$$

这正是 $\nabla(\nabla \cdot \mathbf{v}) - \nabla^2 \mathbf{v}$ 的第 i 个分量。

□

9.7 习题 微分形式

$$1. (1) (x dx + y dy) \wedge (z dz - z dx); (2) (dx + dy + dz) \wedge (x dx \wedge dy - z dy \wedge dz)$$

解:

$$(1) (x dx + y dy) \wedge (z dz - z dx) = xz dx \wedge dz + yz dy \wedge dz + yz dx \wedge dy$$

$$(2) (dx + dy + dz) \wedge (x dx \wedge dy - z dy \wedge dz) = (-z + x) dx \wedge dy \wedge dz$$

2 对下列微分形式 ω , 计算它们的微分, 即计算 $d\omega$.

$$(1) \omega = xy + yz + zx; (2) \omega = xy dx; (3) \omega = xy dx + x^2 dy (4) \omega = x^2 y dx - yze^2 dy + \sin xyz dz (5) \omega = xy^2 dy \wedge dz - xz^2 dx \wedge dy (6) \omega = xy dy \wedge dz + yz dz \wedge dx + zx dx \wedge dy$$

解: (1)

$$d\omega = d\omega_{\varphi}^0 = (y + z)dx + (x + z)dy + (x + y)dz$$

(2)

$$d\omega = d\omega_{\mathbf{v}}^1 = d(xy) \wedge dx = -x dx \wedge dy$$

(3) 设 $\mathbf{v} = xy\mathbf{i} + x^2\mathbf{j}$, 则有

$$\nabla \times \mathbf{v} = (0, 0, x)$$

$$\omega = \omega_{\mathbf{v}}^1 \implies d\omega = \omega_{\nabla \times \mathbf{v}}^2 = x dx \wedge dy$$

(4) 设 $\mathbf{v} = x^2 y \mathbf{i} - yze^2 \mathbf{j} + \sin xyz \mathbf{k}$, 则有

$$\nabla \times \mathbf{v} = (xz \cos xyz + ye^2, -yz \cos xyz, -x^2)$$

$$\omega = \omega_{\mathbf{v}}^1 \implies d\omega = \omega_{\nabla \times \mathbf{v}}^2 = (xz \cos xyz + ye^2) dy \wedge dz - yz \cos xyz dz \wedge dx - x^2 dx \wedge dy$$

(5) 设 $\mathbf{v} = xy^2 \mathbf{i} - xz^2 \mathbf{k}$, 则有

$$\nabla \cdot \mathbf{v} = y^2 - 2xz$$

$$\omega = \omega_{\mathbf{v}}^2 \implies d\omega = \omega_{\nabla \cdot \mathbf{v}}^3 = (y^2 - 2xz) dx \wedge dy \wedge dz$$

(6) 设 $\mathbf{v} = xy\mathbf{i} + yz\mathbf{j} + zx\mathbf{k}$, 则有

$$\nabla \cdot \mathbf{v} = x + y + z$$

$$\omega = \omega_{\mathbf{v}}^2 \implies d\omega = \omega_{\nabla \cdot \mathbf{v}}^3 = (x + y + z) dx \wedge dy \wedge dz$$

9.8 第 9 章综合习题

1. 设 $a_1, a_2, \dots, a_n$ 是非零常数. $f(x_1, x_2, \dots, x_n)$ 在 $\mathbb{R}^n$ 上可微. 求证: 存在 $\mathbb{R}$ 上一元可微函数 $F(s)$ 使得 $f(x_1, x_2, \dots, x_n) = F(a_1x_1 + a_2x_2 + \dots + a_nx_n)$ 的充分必要条件是

$$a_j \frac{\partial f}{\partial x_i} = a_i \frac{\partial f}{\partial x_j}, i, j = 1, 2, \dots, n.$$

证明: 必要性由链式法则立即得到: 若 $f(\mathbf{x}) = F(\mathbf{a} \cdot \mathbf{x})$, 则 $f_{x_i} = F'(\mathbf{a} \cdot \mathbf{x})a_i$, 从而 $a_j f_{x_i} = a_i f_{x_j}$.

反之, 由条件知 $\nabla f(\mathbf{x})$ 与 $\mathbf{a} = (a_1, \dots, a_n)$ 平行. 若 $\mathbf{x}, \mathbf{y}$ 满足 $\mathbf{a} \cdot \mathbf{x} = \mathbf{a} \cdot \mathbf{y}$, 则沿连接二点的线段有

$$\frac{d}{dt} f(\mathbf{x} + t(\mathbf{y} - \mathbf{x})) = \nabla f \cdot (\mathbf{y} - \mathbf{x}) = 0.$$

故 f 在每个超平面 $\mathbf{a} \cdot \mathbf{x} = s$ 上为常数. 例如令 $F(s) = f(s/a_1, 0, \dots, 0)$, 即得 $f(\mathbf{x}) = F(\mathbf{a} \cdot \mathbf{x})$.

□

2. 设 $f(x, y, z) = F(u, v, w)$, 其中 $x^2 = vw, y^2 = wu, z^2 = uv$. 求证:

$$x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} + z \frac{\partial f}{\partial z} = u \frac{\partial F}{\partial u} + v \frac{\partial F}{\partial v} + w \frac{\partial F}{\partial w}$$

证明:

$$\begin{aligned} \text{RHS} &= u \left(\frac{\partial f}{\partial y} \frac{\partial y}{\partial u} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial u} \right) + v \left(\frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial v} \right) + w \left(\frac{\partial f}{\partial x} \frac{\partial x}{\partial w} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial w} \right) \\ &= u \left(\frac{\partial f}{\partial y} \frac{w}{2y} + \frac{\partial f}{\partial z} \frac{v}{2z} \right) + v \left(\frac{\partial f}{\partial x} \frac{w}{2x} + \frac{\partial f}{\partial z} \frac{u}{2z} \right) + w \left(\frac{\partial f}{\partial x} \frac{v}{2x} + \frac{\partial f}{\partial y} \frac{u}{2y} \right) \\ &= \frac{\partial f}{\partial x} \cdot \left(\frac{uv + vw}{2x} \right) + \frac{\partial f}{\partial y} \cdot \left(\frac{wu + uw}{2y} \right) + \frac{\partial f}{\partial z} \cdot \left(\frac{uv + vu}{2z} \right) \\ &= x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} + z \frac{\partial f}{\partial z} = \text{LHS} \end{aligned}$$

□

3. 若函数 $u = f(x, y, z)$ 满足恒等式 $f(tx, ty, tz) = t^k f(x, y, z) (t > 0)$, 则称 $f(x, y, z)$ 为 k 次齐次函数. 试证下述关于齐次函数的欧拉定理: 可微函数 $f(x, y, z)$ 为 k 次齐次函数的充要条件是:

$$x f'_x(x, y, z) + y f'_y(x, y, z) + z f'_z(x, y, z) = k f(x, y, z)$$

证明: (必要性 $\Rightarrow$)

已知 $f(x, y, z)$ 是 k 次齐次函数, 即 $f(tx, ty, tz) = t^k f(x, y, z)$

令 $u = tx, v = ty, w = tz$ 将上式两边对 t 求导数, 由复合函数微分法, 得

$$x f'_u + y f'_v + z f'_w = k t^{k-1} f(x, y, z)$$

将上式两边乘以 t , 得 $txf'_u + tyf'_v + tzf'_w = kt^k f(x, y, z)$

因为 $f(x, y, z)$ 是 k 次齐次函数, 所以上式可以化为

$$uf'_u + vf'_v + wf'_w = kf(u, v, w)$$

再将 u, v, w 换写成 x, y, z 即得

$$xf'_x + yf'_y + zf'_z = kf(x, y, z)$$

(充分性 $\Leftarrow$)

$$\text{设 } G(t) = t^{-k} f(tx, ty, tz), \quad t > 0.$$

$$G'(t) = t^{-k-1} [txf'_x(tx, ty, tz) + tyf'_y(tx, ty, tz) + tzf'_z(tx, ty, tz) - kf(tx, ty, tz)] = 0.$$

故 $G(t) = G(1)$, 即 $f(tx, ty, tz) = t^k f(x, y, z)$. □

4. 设 $f(x, y, z)$ 是 n 次齐次的可微函数. 若方程 $f(x, y, z) = 0$ 隐含函数 $z = \varphi(x, y)$ (即, $f'_z \neq 0$), 则 $\varphi(x, y)$ 是一次齐次函数.

解: 只需指出 $x\varphi'_x + y\varphi'_y = \varphi$. 为此, 在 $f(x, y, z) = 0$ 两端对 x, y 各求导可得

$$f'_x + f'_z z'_x = 0, \quad f'_y + f'_z \cdot z'_y = 0$$

以 x, y 各乘上两式并相加, 有 $xf'_x + yf'_y + f'_z \cdot (xz'_x + yz'_y) = 0$.

注意到 $xf'_x + yf'_y + zf'_z = (x, y, z) \cdot (f'_x, f'_y, f'_z) = \mathbf{n} \cdot \boldsymbol{\tau} = 0$, 带回上式得到,

$$-zf'_z + f'_z \cdot (xz'_x + yz'_y) = 0 \quad \text{即} \quad f'_z \cdot (xz'_x + yz'_y - z) = 0$$

故得 $xz'_x + yz'_y = z$, 则 $\varphi(x, y)$ 是一次齐次函数.

5. 设 $f(x, y)$ 在 $\mathbb{R}^2$ 上有连续二阶偏导数, 且对任意实数 x, y, z 满足 $f(x, y) = f(y, x)$ 和

$$f(x, y) + f(y, z) + f(z, x) = 3f\left(\frac{x+y+z}{3}, \frac{x+y+z}{3}\right)$$

试求 $f(x, y)$ 解: 令 $g(t) = f(t, t)$. 原等式分别对 x, y 求导, 得

$$f_{xy}(x, y) = \frac{1}{3}g''\left(\frac{x+y+z}{3}\right).$$

左边与 z 无关, 故 g'' 为常数, 记为 c , 从而 $f_{xy} = c/3$. 再对原等式关于 x 求二阶导, 利用对称性得

$$f_{xx}(x, y) + f_{xx}(x, z) = \frac{c}{3},$$

故 $f_{xx} = f_{yy} = c/6$. 积分并利用 $f(x, y) = f(y, x)$, 得到全部解

$$f(x, y) = A(x^2 + 4xy + y^2) + B(x + y) + C, \quad A, B, C \in \mathbb{R}.$$

直接代回可验证这些函数均满足原等式.

6. 证明不等式 $\frac{x^2+y^2}{4} \leq e^{x+y-2} (x \geq 0, y \geq 0)$.

证明: 要证不等式 $\frac{x^2+y^2}{4} \leq e^{x+y-2} (x \geq 0, y \geq 0)$. 只需证 $f(x) = \frac{x^2+y^2}{e^{x+y}}$ 在 $x \geq 0, y \geq 0$ 区域内最大值为 $\frac{4}{e^2}$ (1°)

$$\begin{cases} f'_x = \frac{2x - x^2 - y^2}{e^{x+y}} = 0 \\ f'_y = \frac{2y - x^2 - y^2}{e^{x+y}} = 0 \end{cases} \Rightarrow \text{驻点 } M_1(0, 0), f(0, 0) = 0, M_2(1, 1), f(1, 1) = \frac{2}{e^2}$$

(2°)

$$\begin{aligned} \text{在边界 } \partial D \text{ 上, 不妨令 } x=0, \quad g(y) &= \frac{y^2}{e^y}, \quad g'(y) = \frac{y(2-y)}{e^y} \\ y=2 \text{ 时, } g(y)_{\max} &= \frac{4}{e^2} \\ \Rightarrow \frac{x^2+y^2}{e^{x+y}} &\leq \frac{4}{e^2} \Leftrightarrow \frac{x^2+y^2}{4} \leq e^{x+y-2} (x \geq 0, y \geq 0) \end{aligned}$$

□

7. 设在 $\mathbb{R}^3$ 上定义的 $u = f(x, y, z)$ 是 z 的连续函数, 且 $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}$ 在 $\mathbb{R}^3$ 上连续. 证明 u 在 $\mathbb{R}^3$ 上连续.

证明: 任意取定点 $X_0 = (x_0, y_0, z_0) \in \mathbb{R}^3$, 并作闭区域:

$$D = \{(x, y, z) : |x - x_0| \leq 1, |y - y_0| \leq 1, |z - z_0| \leq 1\}$$

$$\text{再取 } M > 0, \text{ 使得 } \left| \frac{\partial f(x, y, z)}{\partial x} \right| \leq M, \quad \left| \frac{\partial f(x, y, z)}{\partial y} \right| \leq M, \quad (x, y, z) \in D$$

由微分中值公式可以得到,

$$\begin{aligned} & |f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) - f(x_0, y_0, z_0)| \\ & \leq |f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) - f(x_0, y_0, z_0 + \Delta z)| + |f(x_0, y_0, z_0 + \Delta z) - f(x_0, y_0, z_0)| \\ & \leq |f'_x(x_0 + \theta \Delta x, y_0 + \theta \Delta y, z_0 + \Delta z) \Delta x| + |f'_y(x_0 + \theta \Delta x, y_0 + \theta \Delta y, z_0 + \Delta z) \Delta y| \\ & \quad + |f(x_0, y_0, z_0 + \Delta z) - f(x_0, y_0, z_0)| \\ & \leq M|\Delta x| + M|\Delta y| + \varepsilon \quad (\text{取 } |\Delta z| < \delta) \\ & < M\left(\frac{\varepsilon}{M}\right) + M\left(\frac{\varepsilon}{M}\right) + \varepsilon < 3\varepsilon \quad (\text{取 } |\Delta x|, |\Delta y| < \frac{\varepsilon}{M} < \delta) \\ \therefore \lim_{\Delta x \rightarrow 0, \Delta y \rightarrow 0, \Delta z \rightarrow 0} f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) &= f(x_0, y_0, z_0), \text{ 故 } u = f(x, y, z) \in C(\mathbb{R}^3). \quad \square \end{aligned}$$

8. 设 $D \subset \mathbb{R}^2$ 是包含原点的凸区域, $f \in C^1(D)$. 若

$$x \frac{\partial f(x, y)}{\partial x} + y \frac{\partial f(x, y)}{\partial y} = 0, ((x, y) \in D)$$

则 $f(x, y)$ 是常数.

解: 固定 $(x, y) \in D$, 令 $h(t) = f(tx, ty)$ 。因 D 为含原点的凸区域, $0 \leq t \leq 1$ 时 $(tx, ty) \in D$ 。对 $t > 0$,

$$h'(t) = xf_x(tx, ty) + yf_y(tx, ty) = \frac{1}{t} [txf_x(tx, ty) + tyf_y(tx, ty)] = 0.$$

由连续性延拓到 $t = 0$, 故 $f(x, y) = h(1) = h(0) = f(0, 0)$ 。

9. 设 $f \in C^1(\mathbb{R}^2)$, $f(0, 0) = 0$. 证明: 存在 $\mathbb{R}^2$ 上的连续函数 g_1, g_2 使得

$$f(x, y) = xg_1(x, y) + yg_2(x, y)$$

证明:

$$f(x, y) = \int_0^1 \frac{d}{dt} f(tx, ty) dt = \int_0^1 [xf'_x(tx, ty) + yf'_y(tx, ty)] dt$$

$$\text{令 } g_1 = \int_0^1 f'_x(tx, ty) dt, g_2 = \int_0^1 f'_y(tx, ty) dt.$$

由于 f_x, f_y 连续, 且积分参数区间 $[0, 1]$ 为紧集, 上述两个参数积分均为 (x, y) 的连续函数。因此 g_1, g_2 连续, 结论成立。□

10. 设 $f(x, y)$ 在 (x_0, y_0) 的某个邻域 U 上有定义, $\frac{\partial f}{\partial x}$ 和 $\frac{\partial f}{\partial y}$ 在 U 上存在. 求证: 如果 $\frac{\partial f}{\partial x}$ 和 $\frac{\partial f}{\partial y}$ 中有一个在 (x_0, y_0) 处连续, 那么 $f(x, y)$ 在 (x_0, y_0) 可微。

证明: 不妨设 f_x 在 (x_0, y_0) 连续。令 $h = \Delta x, k = \Delta y$, 则

$$\begin{aligned} \Delta f &= f(x_0 + h, y_0 + k) - f(x_0, y_0 + k) \\ &\quad + f(x_0, y_0 + k) - f(x_0, y_0) \\ &= f_x(x_0 + \theta h, y_0 + k)h + f_y(x_0, y_0)k + o(k) \\ &= f_x(x_0, y_0)h + f_y(x_0, y_0)k + o(\sqrt{h^2 + k^2}). \end{aligned}$$

这里第一步使用一元中值定理, 最后一步使用 f_x 在该点的连续性。故 f 在 (x_0, y_0) 可微; f_y 连续的情形同理。□

11. 设 $u(x, y)$ 在 $\mathbb{R}^2$ 上取正值且有二阶连续偏导数. 证明 u 满足方程

$$u \frac{\partial^2 u}{\partial x \partial y} = \frac{\partial u}{\partial x} \frac{\partial u}{\partial y}$$

的充分必要条件是存在一元函数 f 和 g 使得 $u(x, y) = f(x)g(y)$ 。

证明: $\Leftarrow$ (充分性)

$$\begin{aligned} \because u(x, y) &= f(x)g(y), \quad \frac{\partial u}{\partial x} = f'(x)g(y), \quad \frac{\partial u}{\partial y} = f(x)g'(y) \\ \therefore u \frac{\partial^2 u}{\partial x \partial y} &= f(x)g(y)f'(x)g'(y) = \frac{\partial u}{\partial x} \frac{\partial u}{\partial y} \end{aligned}$$

$\Rightarrow$ (充分性)

$$\begin{aligned} \text{令 } v &= \frac{\partial u}{\partial y}, \quad uv'_x = vu'_x \Rightarrow \left(\frac{v}{u}\right)'_x = 0 \\ \text{设 } F_1(y) &= \frac{v}{u}, \quad \frac{\partial u}{\partial y} = uF_1(y) \\ \Rightarrow \int \frac{du}{u} &= \int F_1(y) \Rightarrow \ln u = F_2(y) + F_3(x) \\ \therefore u &= e^{F_2(y)} e^{F_3(x)} = f(x)g(y) \end{aligned}$$

所以 u 满足方程 $u \frac{\partial^2 u}{\partial x \partial y} = \frac{\partial u}{\partial x} \frac{\partial u}{\partial y}$ 的充分必要条件是存在一元函数 f 和 g 使得 $u(x, y) = f(x)g(y)$.
□

12. 设 $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}, t \in [a, b]$ 有连续的导数, 证明: 存在 $\theta \in (a, b)$, 使得

$$|\mathbf{r}(b) - \mathbf{r}(a)| \leq |\mathbf{r}'(\theta)| (b - a).$$

提示: 令 $\varphi(t) = (x(b) - x(a))x(t) + (y(b) - y(a))y(t)$, 对函数 $\varphi(t)$ 使用微分中值定理, 并利用 Cauchy-Schwarz 不等式: $(a_1b_1 + a_2b_2)^2 \leq (a_1^2 + a_2^2)(b_1^2 + b_2^2)$. 解:

$$\begin{aligned} \varphi(b) - \varphi(a) &= (x(b) - x(a))^2 + (y(b) - y(a))^2 \\ &= (b - a) \cdot ((x(b) - x(a))x'(\theta) + (y(b) - y(a))y'(\theta)) \quad \theta \in (a, b) \\ &\leq (b - a) \cdot \sqrt{(x'^2(\theta) + y'^2(\theta)) \cdot ((x(b) - x(a))^2 + (y(b) - y(a))^2)} \end{aligned}$$

$$\text{所以有 } (x(b) - x(a))^2 + (y(b) - y(a))^2 \leq (b - a)^2 (x'^2(\theta) + y'^2(\theta))$$

$$\Leftrightarrow |\mathbf{r}(b) - \mathbf{r}(a)| \leq |\mathbf{r}'(\theta)| (b - a). \quad \square$$

13. 设 $f(x, y, z)$ 在 $\mathbb{R}^3$ 上有一阶连续偏导数, 且满足 $\frac{\partial f}{\partial x} = \frac{\partial f}{\partial y} = \frac{\partial f}{\partial z}$. 如果 $f(x, 0, 0) > 0$ 对任意的 $x \in \mathbb{R}$ 成立, 求证: 对任意的 $(x, y, z) \in \mathbb{R}^3$, 也有 $f(x, y, z) > 0$.

证明:

对于函数 $f(x, y, z)$, 假设 $M_0(x_0, y_0, z_0)$, 以此点展开零阶 Taylor 公式得到:

$$\begin{aligned} f(x, y, z) &= f(x_0, y_0, z_0) + f'_x(x_0 + \theta(x - x_0), y_0 + \theta(y - y_0), z_0 + \theta(z - z_0))(x - x_0) \\ &\quad + f'_y(x_0 + \theta(x - x_0), y_0 + \theta(y - y_0), z_0 + \theta(z - z_0))(y - y_0) \\ &\quad + f'_z(x_0 + \theta(x - x_0), y_0 + \theta(y - y_0), z_0 + \theta(z - z_0))(z - z_0), \exists \theta \in (0, 1), \forall (x, y, z) \in \mathbb{R}^3, \end{aligned}$$

$$\because f(x + y + z, 0, 0) > 0,$$

$$\begin{aligned} \therefore f(x, y, z) &= f(x + y + z, 0, 0) + f'_x(x + y + z + \theta(-y - z), \theta y, \theta z)(-y - z) \\ &\quad + f'_y(x + y + z + \theta(-y - z), \theta y, \theta z)(y) + f'_z(x + y + z + \theta(-y - z), \theta y, \theta z)(z) \\ &= f(x + y + z, 0, 0) + f'_x \cdot (-y - z + y + z) = f(x + y + z, 0, 0) > 0 \end{aligned}$$

于是结论得证。 □

14. 求函数 $f(x, y) = x^2 + xy^2 - x$ 在区域 $D = \{(x, y) \mid x^2 + y^2 \leq 2\}$ 上的最大值和最小值.

解:

$$(1^\circ) \text{由驻点条件} \begin{cases} f'_x = 2x + y^2 - 1 = 0 \\ f'_y = 2xy = 0 \end{cases} \Rightarrow \text{得到驻点和取值} \begin{cases} M_1(0, 1), f(M_1) = 0 \\ M_2(0, -1), f(M_2) = 0 \\ M_3(\frac{1}{2}, 0), f(M_3) = -\frac{1}{4} \end{cases}$$

(2°) 在边界 ∂D 上, $y^2 = 2 - x^2$, $\therefore g(x) = -x^3 + x^2 + x, x \in [-\sqrt{2}, \sqrt{2}]$,

$$g'(x) = -3x^2 + 2x + 1 = 0, x_1 = -\frac{1}{3}, x_2 = 1$$

$$\text{在两个端点 } g(-\sqrt{2}) = 2 + \sqrt{2}, \quad g(\sqrt{2}) = 2 - \sqrt{2},$$

$$\text{又 } \because g''(x_1) > 0 \text{ 取极小, } g''(x_2) < 0 \text{ 取极大, } g(x_1) = -\frac{5}{27}, g(x_2) = 1$$

比较内部驻点与边界值, 故全局最小值为 $-1/4$, 在 $(1/2, 0)$ 处取得; 全局最大值为 $2 + \sqrt{2}$, 在 $(-\sqrt{2}, 0)$ 处取得.

15. 设 $x_1, x_2, \dots, x_n$ 是正数, 且 $x_1 + x_2 + \dots + x_n = n$. 用 Lagrange 乘数法证明

$$x_1 x_2 \cdots x_n \left(\frac{1}{x_1} + \frac{1}{x_2} + \cdots + \frac{1}{x_n} \right) \leq n$$

等号当且仅当 $x_1 = x_2 = \cdots = x_n = 1$ 时成立.

证明: (1°) 设 Lagrange 辅助函数:

$$F(x_1, x_2, \dots, x_n, \lambda) = x_1 x_2 \cdots x_n \left(\frac{1}{x_1} + \frac{1}{x_2} + \cdots + \frac{1}{x_n} \right) + \lambda (x_1 + x_2 + \cdots + x_n - n)$$

$$(2^\circ) \text{由驻点条件} \begin{cases} F'_{x_1} = 0 \\ F'_{x_2} = 0 \\ \vdots \\ F'_{x_n} = 0 \\ F'_\lambda = 0 \end{cases} \Rightarrow \text{取值关系} \begin{cases} x_2 x_3 \cdots x_n \left(\frac{1}{x_2} + \frac{1}{x_3} + \cdots + \frac{1}{x_n} \right) + \lambda = 0 \\ x_1 x_3 \cdots x_n \left(\frac{1}{x_1} + \frac{1}{x_3} + \cdots + \frac{1}{x_n} \right) + \lambda = 0 \\ \vdots \\ x_1 x_2 \cdots x_{n-1} \left(\frac{1}{x_1} + \frac{1}{x_2} + \cdots + \frac{1}{x_{n-1}} \right) + \lambda = 0 \\ x_1 + x_2 + \cdots + x_n - n = 0 \end{cases}$$

解得 $x_1 = x_2 = \cdots = x_n = 1$, 故驻点 $M_0(1, 1, \dots, 1)$

该驻点的函数值为 n .

$$\therefore x_1 x_2 \cdots x_n \left(\frac{1}{x_1} + \frac{1}{x_2} + \cdots + \frac{1}{x_n} \right) \leq n \text{ (当仅当 } x_i = 1 \text{ 时取等)}$$

在闭单纯形的边界上, 若恰有一个变量为零, 则目标函数为其余 $n-1$ 个变量的乘积, 至多为 $(n/(n-1))^{n-1} \leq n$; 若至少两个变量为零, 目标函数为零. 因此内部驻点给出全局最大值, 证毕.

□

★ 重要的平均不等式

$$\left(\frac{x_1^{-1} + x_2^{-1} + \cdots + x_n^{-1}}{n}\right)^{-1} \leq \sqrt[n]{x_1 x_2 \cdots x_n} \leq \frac{x_1 + x_2 + \cdots + x_n}{n} \leq \sqrt{\frac{x_1^2 + \cdots + x_n^2}{n}}$$

$$(\bar{H} \leq \bar{G} \leq \bar{A} \leq \text{RMS})$$

i. 第一、二组不等号证明:

设 lagrange 辅助函数 $F(x_1, x_2, \cdots, \lambda) = x_1 x_2 \cdots x_n + \lambda(x_1 + x_2 + \cdots + x_n - a)$, $x_i > 0$

讨论最大值只能在驻点取得, $x_1 x_2 \cdots x_n \leq \left(\frac{a}{n}\right)^n = \left(\frac{x_1 + x_2 + \cdots + x_n}{n}\right)^n$, 变形得证

ii. 第三组不等号证明:

$$\text{Cauchy 不等式: } \sum_{i=1}^n (a_i b_i)^2 \leq \left(\sum_{i=1}^n a_i^2\right) \left(\sum_{i=1}^n b_i^2\right), \quad a_i = 1, b_i = x_i$$

$$\Rightarrow \frac{(\sum_{i=1}^n x_i)^2}{n^2} \leq \frac{n \sum_{i=1}^n x_i^2}{n^2} \Rightarrow \frac{x_1 + x_2 + \cdots + x_n}{n} \leq \sqrt{\frac{x_1^2 + \cdots + x_n^2}{n}}$$

★ 注: 上述式子仅在 $x_1 = x_2 = \cdots = x_n$ 时取等。

16. 设 $a_i \geq 0 (i = 1, 2, \cdots, n)$, $p > 1$. 证明:

$$\frac{a_1 + \cdots + a_n}{n} \leq \left(\frac{a_1^p + \cdots + a_n^p}{n}\right)^{\frac{1}{p}}$$

并讨论等号成立的条件.

证明: 因 $p > 1$, 函数 $t \mapsto t^p$ 在 $[0, \infty)$ 上严格凸. 由 Jensen 不等式,

$$\left(\frac{a_1 + \cdots + a_n}{n}\right)^p \leq \frac{a_1^p + \cdots + a_n^p}{n}.$$

两边取 p 次方根即得所证不等式. 严格凸性表明, 等号当且仅当 $a_1 = \cdots = a_n$. □

17. 设 $y_i = y_i(x_1, \cdots, x_n)$, $i = 1, 2, \cdots$ 是 n 个可微的 n 元函数, 证明

$$dy_1 \wedge dy_2 \wedge \cdots \wedge dy_n = \frac{\partial(y_1, y_2, \cdots, y_n)}{\partial(x_1, x_2, \cdots, x_n)} dx_1 \wedge dx_2 \wedge \cdots \wedge dx_n$$

证明:

$$\begin{aligned} dy_j &= \sum_{i=1}^n \frac{\partial y_j}{\partial x_i} dx_i = \frac{\partial y_j}{\partial x_1} dx_1 + \frac{\partial y_j}{\partial x_2} dx_2 + \cdots + \frac{\partial y_j}{\partial x_n} dx_n \\ \text{LHS} &= \left(\sum_{i=1}^n \frac{\partial y_1}{\partial x_i} dx_i \right) \wedge \left(\sum_{i=1}^n \frac{\partial y_2}{\partial x_i} dx_i \right) \wedge \cdots \wedge \left(\sum_{i=1}^n \frac{\partial y_n}{\partial x_i} dx_i \right) \\ &= \frac{\partial(y_1, y_2, \cdots, y_n)}{\partial(x_1, x_2, \cdots, x_n)} dx_1 \wedge dx_2 \wedge \cdots \wedge dx_n = \text{RHS} \end{aligned}$$

□

10 多变量函数的重积分

10.1 习题 二重积分

1. 改变下列积分的顺序.(画出积分区域 + 改变积分顺序)

$$(1) \int_{-1}^1 dx \int_0^{\sqrt{1-x^2}} f(x, y) dy;$$

(1) 解:

$$I = \int_0^1 dy \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} f(x, y) dx$$

$$(2) \int_0^2 dx \int_{2x}^{6-x} f(x, y) dy$$

(2) 解:

$$I = \int_0^4 dy \int_0^{\frac{y}{2}} f(x, y) dx + \int_4^6 dy \int_0^{6-y} f(x, y) dx$$

$$(3) \int_0^a dy \int_{a-\sqrt{a^2-y^2}}^{a+\sqrt{a^2-y^2}} f(x, y) dx;$$

(3) 解:

$$I = \int_0^{2a} dx \int_0^{\sqrt{a^2-(x-a)^2}} f(x, y) dy$$

$$(4) \int_a^b dy \int_y^b f(x, y) dx;$$

(4) 解:

$$I = \int_a^b dx \int_a^x f(x, y) dy$$

$$(5) \int_0^1 dx \int_0^x f(x, y) dy + \int_1^2 dx \int_0^{2-x} f(x, y) dy;$$

(5) 解:

$$I = \int_0^1 dy \int_y^{2-y} f(x, y) dx$$

$$(6) \int_0^1 dy \int_{\frac{1}{2}}^1 f(x, y) dx + \int_1^2 dy \int_{\frac{1}{2}}^{\frac{1}{y}} f(x, y) dx$$

(6) 解:

$$I = \int_{\frac{1}{2}}^1 dx \int_0^{\frac{1}{x}} f(x, y) dy$$

2. 计算下列积分.

$$(1) \iint_D \frac{y}{(1+x^2+y^2)^{\frac{3}{2}}} dx dy, D = [0, 1]^2$$

(1) 解:

$$\begin{aligned} I &= \int_0^1 dx \int_0^1 \frac{y}{(1+x^2+y^2)^{\frac{3}{2}}} dy \\ &= \int_0^1 \left(\frac{-1}{1+x^2+y^2} \right) \bigg|_0^1 dx \\ &= \int_0^1 \left(\frac{1}{\sqrt{1+x^2}} - \frac{1}{\sqrt{x^2+2}} \right) dx \\ &\because \int \frac{dx}{\sqrt{x^2+a^2}} = \ln |x + \sqrt{x^2+a^2}| + C, \\ \therefore I &= \ln \left| \frac{x + \sqrt{x^2+1}}{x + \sqrt{x^2+2}} \right| \bigg|_0^1 \\ I &= \ln |x + \sqrt{x^2+1}| \bigg|_0^1 - \ln |x + \sqrt{x^2+2}| \bigg|_0^1 \\ &= \ln(1 + \sqrt{2}) - \ln \frac{1 + \sqrt{3}}{\sqrt{2}} \\ &= \ln \frac{2 + \sqrt{2}}{1 + \sqrt{3}} \end{aligned}$$

$$(2) \iint_D \sin(x+y) dx dy, D = [0, \pi]^2$$

$$\begin{aligned} I &= \int_0^\pi dx \int_0^\pi \sin(x+y) dy \\ &= \int_0^\pi -\cos(x+y) \big|_0^\pi dx \\ (2) \text{ 解: } &= \int_0^\pi (2 \cos x) dx \\ &= 2 \sin x \big|_0^\pi = 0 \end{aligned}$$

$$(3) \iint_D \cos(x+y) dx dy, \quad D: \text{由 } y = \pi, x = y, x = 0 \text{ 围成};$$

$$\begin{aligned} I &= \int_0^\pi dy \int_0^y \cos(x+y) dx \\ &= \int_0^\pi (\sin(x+y) \big|_0^y) dy \\ (3) \text{ 解: } &= \int_0^\pi (\sin 2y - \sin y) dy \\ &= \left(-\frac{1}{2} \cos 2y + \cos y \right) \bigg|_0^\pi = -2 \end{aligned}$$

$$(4) \iint_D (x+y) dx dy, D: \text{由 } x^2 + y^2 = a^2 \text{ 围成的圆在第一象限部分};$$

$$\begin{aligned} I &= \int_0^a dy \int_0^{\sqrt{a^2-y^2}} (x+y) dx \\ &= \int_0^a \left(\frac{x^2}{2} + yx \right) \bigg|_0^{\sqrt{a^2-y^2}} dy \\ &= \int_0^a \left(\frac{a^2-y^2}{2} + y\sqrt{a^2-y^2} \right) dy \\ (4) \text{ 解: } &= \left(\frac{a^2}{2} y - \frac{y^3}{6} - \frac{1}{3} (a^2-y^2)^{\frac{3}{2}} \right) \bigg|_0^a \\ &= \frac{a^3}{2} - \frac{a^3}{6} + \frac{1}{3} a^3 \\ &= \frac{2}{3} a^3 \end{aligned}$$

$$(5) \iint_D (x+y-1) dx dy, \quad D: \text{由 } y = x, y = x+a, y = a, y = 3a \text{ 围成};$$

$$\begin{aligned} I &= \int_a^{3a} dy \int_{y-a}^y (x+y-1) dx \\ (5) \text{ 解: } &= \int_a^{3a} \left(2ay - \frac{a^2}{2} - a \right) dy = 7a^3 - 2a^2. \end{aligned}$$

$$(6) \iint_D \frac{\sin y}{y} dx dy, \quad D: \text{由 } y = x \text{ 和 } x = y^2 \text{ 围成};$$

$$\begin{aligned}
 I &= \int_0^1 dy \int_{y^2}^y \frac{\sin y}{y} dx \\
 &= \int_0^1 \frac{\sin y}{y} (y - y^2) dy \\
 (6) \text{ 解: } &= \int_0^1 (\sin y - y \sin y) dy \\
 &= (y \cos y - \sin y - \cos y)|_0^1 \\
 &= 1 - \sin 1
 \end{aligned}$$

$$\begin{aligned}
 I &= \int_{\frac{1}{2}}^1 dy \int_{\frac{1}{y}}^2 \frac{x^2}{y^2} dx + \int_1^2 dy \int_y^2 \frac{x^2}{y^2} dx \\
 &= \int_{\frac{1}{2}}^1 \left(\frac{8}{3y^2} - \frac{1}{3y^5} \right) dy + \int_1^2 \left(\frac{8}{3y^2} - \frac{y}{3} \right) dy \\
 &= \frac{17}{12} + \frac{5}{6} = \frac{9}{4}.
 \end{aligned}$$

(8) $\iint_D |\cos(x+y)| dx dy$, 其中 D 是由直线 $y=x, y=0, x=\frac{\pi}{2}$ 所围成;

(7) $\iint_D \frac{x^2}{y^2} dx dy$, D : 由 $x=2, y=x$ 及 $xy=1$ 围成.

(8) 解:

$$\begin{aligned}
 I &= \int_0^{\pi/4} dx \int_0^x \cos(x+y) dy + \int_{\pi/4}^{\pi/2} dx \int_0^{\pi/2-x} \cos(x+y) dy \\
 &\quad - \int_{\pi/4}^{\pi/2} dx \int_{\pi/2-x}^x \cos(x+y) dy = \frac{\pi}{2} - 1.
 \end{aligned}$$

(7) 解:

3. 利用函数的奇偶性计算下列积分:

(1) $\iint_D (x^2 + y^2) dx dy$, $D: -1 \leq x \leq 1, -1 \leq y \leq 1$;

(1) 解: 利用对称性并直接逐次积分,

$$I = 2 \int_{-1}^1 dy \int_{-1}^1 x^2 dx = 2 \cdot 2 \cdot \frac{2}{3} = \frac{8}{3}.$$

(2) $\iint_D \sin x \sin y dx dy$, $D: x^2 - y^2 = 1, x^2 + y^2 = 9$ 围成含原点的部分;

$$(2) \text{ 解: } I = \iint_{D_1} + \iint_{D_2} = 0, \begin{cases} D_1: x \geq 0, & x^2 - y^2 \leq 1, x^2 + y^2 \leq 9 \\ D_2: x \leq 0, & x^2 - y^2 \leq 1, x^2 + y^2 \leq 9 \end{cases}$$

4. 设函数 φ 和 ψ 分别在区间 $[a, b]$ 和 $[c, d]$ 上可积, 求证 $f(x, y) = \varphi(x)\psi(y)$ 在 $D = [a, b] \times [c, d]$ 上可积, 且有

$$\iint_D f(x, y) dx dy = \int_a^b \varphi(x) dx \int_c^d \psi(y) dy.$$

4. 证明乘积函数可积, 并由 Fubini 定理

$$\iint_D \varphi(x)\psi(y) dx dy = \int_c^d \psi(y) \left(\int_a^b \varphi(x) dx \right) dy = \left(\int_a^b \varphi(x) dx \right) \left(\int_c^d \psi(y) dy \right).$$

5. 设函数 $f(x)$ 在 $[0, a]$ 上连续, 证明

$$\int_0^a dx \int_0^x f(x)f(y)dy = \frac{1}{2} \left(\int_0^a f(x)dx \right)^2,$$
 第一式的被积函数关于 x, y 对称, 而三角形 $0 \leq y \leq x \leq a$ 恰为正方形 $[0, a]^2$ 的一半, 故第一式成立。第二式交换积分次序:

$$\int_0^a dx \int_0^x f(y) dy = \int_0^a f(y) \left(\int_y^a dx \right) dy = \int_0^a (a-y)f(y) dy.$$

□

6. 设函数 $f(x, y)$ 有连续的二阶偏导数, 在 $D = [a, b] \times [c, d]$ 上, 求积分

$$\iint_D \frac{\partial^2 f(x, y)}{\partial x \partial y} dx dy$$

解: Use Newton-Leibniz Formula:

$$\begin{aligned}
 \int_a^b \frac{dF(x)}{dx} &= \int_a^b F'(x) = F(b) - F(a) \\
 I &= \int_c^d \left(\int_a^b (f'_y(x, y))'_x dx \right) dy = \int_c^d (f'_y(x, y)|_a^b) dy \\
 &= \int_c^d (f'_y(b, y) - f'_y(a, y)) dy = f(b, y)|_c^d - f(a, y)|_c^d \\
 &= f(b, d) - f(b, c) - f(a, d) + f(a, c)
 \end{aligned}$$

7. 设函数 $f(x, y)$ 连续, 求极限

$$\lim_{r \rightarrow 0} \frac{1}{\pi r^2} \iint_{x^2+y^2 \leq r^2} f(x, y) dx dy$$

解: $\because f \in C(D)$, 积分中值定理得,

$$\exists M(x, y_0) \in D, \iint_D f(x, y) dx dy = f(x_0, y_0) \cdot S(D)$$

$$\because S(D) = \pi r^2,$$

$$\therefore \lim_{r \rightarrow 0} \frac{1}{\pi r^2} \iint_{x^2+y^2 \leq r^2} f(x, y) dx dy = \lim_{(x_0, y_0) \rightarrow (0, 0)} f(x_0, y_0) = f(0, 0).$$

10.2 习题 二重积分换元

1. 计算下列积分.

$$(1) \int_0^R dx \int_0^{\sqrt{R^2-x^2}} \ln(1+x^2+y^2) dy;$$

$$\begin{aligned} I &= \int_0^{\frac{\pi}{2}} d\theta \int_0^R \ln(1+r^2) r dr \\ (1) \text{ 解: } &= \left(\int_0^{\frac{\pi}{2}} d\theta \right) \frac{1}{2} \int_0^R \ln(1+r^2) dr^2 \\ &= \frac{\pi}{4} \left[(1+r^2) \ln(1+r^2) - r^2 \right] \Big|_0^R \\ &= \frac{\pi}{4} [(R^2+1) \ln(R^2+1) - R^2] \end{aligned}$$

$$(2) \int_0^a dx \int_0^b xy(x^2-y^2) dy;$$

$$\begin{aligned} I &= \int_0^a dx \int_0^b (x^3y - xy^3) dy \\ &= \int_0^a \left(\frac{1}{2}x^3y^2 - \frac{1}{4}xy^4 \right) \Big|_0^b dx \\ (2) \text{ 解: } &= \int_0^a \left(\frac{b^2}{2}x^3 - \frac{b^4}{4}x \right) dx \\ &= \left(\frac{b^2}{8}x^4 - \frac{b^4}{8}x^2 \right) \Big|_0^a \\ &= \frac{b^2a^4 - b^4a^2}{8} \end{aligned}$$

$$(3) \int_0^\pi \int_0^\pi \cos(x+y) dx dy;$$

$$\begin{aligned} I &= \int_0^\pi dy \int_0^\pi \cos(x+y) dx \\ &= \int_0^\pi (\sin(x+y)) \Big|_0^\pi dy \\ (3) \text{ 解: } &= \int_0^\pi (-2 \sin y) dy \\ &= (2 \cos y) \Big|_0^\pi \\ &= -4 \end{aligned}$$

$$2. \text{ 计算下面二重积分. } (1) \iint_D \sqrt{x^2+y^2} dx dy, \quad D: x^2+y^2 \leq x+y;$$

$$(4) \int_0^{\frac{1}{\sqrt{2}}} dx \int_x^{\sqrt{1-x^2}} xy(x+y) dy;$$

(4) 解:

$$\text{let } x = r \cos \theta, y = r \sin \theta$$

$$\begin{aligned} I &= \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} d\theta \int_0^1 r^4 \sin \theta \cos \theta (\sin \theta + \cos \theta) dr \\ &= \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \left(\frac{r^5}{5} \cos \theta \sin \theta (\sin \theta + \cos \theta) \right) \Big|_0^1 d\theta \\ &= \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \frac{1}{5} \cdot \frac{1}{2} \sin 2\theta (\sin \theta + \cos \theta) d\theta \\ &= \frac{1}{5} \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \frac{\pi}{2} \frac{1}{2} \sin 2\theta (\sin \theta + \cos \theta) d\theta \\ &= \frac{1}{5} \cdot \frac{1}{3} (\sin^3 \theta - \cos^3 \theta) \Big|_{\frac{\pi}{4}}^{\frac{\pi}{2}} \\ &= \frac{1}{15} \end{aligned}$$

$$(5) \int_0^{\frac{R}{\sqrt{1+R^2}}} dx \int_0^{Rx} \left(1 + \frac{y^2}{x^2} \right) dy + \int_{\frac{R}{\sqrt{1+R^2}}}^R dx \int_0^{\sqrt{R^2-x^2}} \left(1 + \frac{y^2}{x^2} \right) dy$$

(5) 解:

$$\text{let } x = r \cos \theta, \quad y = r \sin \theta$$

$$\begin{aligned} I &= \int_0^{\arctan R} d\theta \int_0^R (1 + \tan^2 \theta) r dr \\ &= \int_0^{\arctan R} \left(\frac{1}{2} R^2 \sec^2 \theta \right) d\theta \\ &= \frac{1}{2} R^2 \tan \theta \Big|_0^{\arctan R} \\ &= \frac{1}{2} R^3 \end{aligned}$$

2(1) 解: 令 $x = r \cos \theta, y = r \sin \theta$, 则

$$-\frac{\pi}{4} \leq \theta \leq \frac{3\pi}{4}, \quad 0 \leq r \leq \cos \theta + \sin \theta.$$

因此

$$I = \frac{1}{3} \int_{-\pi/4}^{3\pi/4} (\cos \theta + \sin \theta)^3 d\theta = \frac{8\sqrt{2}}{9}.$$

(2) $\iint_D \sqrt{\frac{x^2}{a^2} + \frac{y^2}{b^2}} dx dy$, $D: \frac{x^2}{a^2} + \frac{y^2}{b^2} = 4, y = 0, y = x$ 所围成的第一象限部分;

(2) 解: 令 $x = ar \cos \theta, y = br \sin \theta$. 直线 $y = x$ 对应 $\theta = \arctan(a/b)$, 故

$$I = ab \int_0^{\arctan(a/b)} d\theta \int_0^2 r^2 dr = \frac{8ab}{3} \arctan \frac{a}{b}.$$

(3) $\iint_D (x^2 + y^2) dx dy$, $D: \text{由 } xy = 1, xy = 2, y = x, y = 2x \text{ 围成的第一象限部分};$

(3) 解: let $\begin{cases} u = xy \\ v = \frac{y}{x} \end{cases}, D' = \begin{cases} 1 \leq u \leq 2 \\ 1 \leq v \leq 2 \end{cases} \quad x^2 = \frac{u}{v}, y^2 = uv,$

$$\begin{aligned} dx dy &= \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du dv = \frac{du dv}{\left| \frac{\partial(u, v)}{\partial(x, y)} \right|} = \frac{du dv}{\left\| \begin{array}{cc} y & x \\ -\frac{y}{x^2} & \frac{1}{x} \end{array} \right\|} = \frac{du dv}{2v} \\ I &= \iint_{D'} \left(\frac{u}{v} + uv \right) \frac{du dv}{2v} = \int_1^2 dv \int_1^2 \left(\frac{u}{2v^2} + \frac{u}{2} \right) du \\ &= \int_1^2 \left(\frac{u^2}{4v^2} + \frac{u^2}{4} \right) \Big|_1^2 dv = \left(\frac{3v}{4} - \frac{3}{4v} \right) \Big|_1^2 = \frac{9}{8} \end{aligned}$$

(4) $\iint_D dx dy$, $D: \text{由 } y^2 = ax, y^2 = bx, x^2 = my, x^2 = ny \text{ 围成的区域}$
($a > b > 0, m > n > 0$)

(4) 解:

$$\begin{aligned} \text{let } u &= \frac{y^2}{x}, \quad v = \frac{x^2}{y}, \quad b \leq u \leq a, n \leq v \leq m, \\ du dv &= \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du dv \\ &= \frac{du dv}{\left| \frac{\partial(u, v)}{\partial(x, y)} \right|} = \frac{du dv}{\left\| \begin{array}{cc} -\frac{y^2}{x^2} & \frac{2y}{x} \\ \frac{2x}{y} & -\frac{x^2}{y^2} \end{array} \right\|} = \frac{du dv}{3} \\ I &= \int_b^a du \int_n^m \frac{dv}{3} = \frac{(m-n)(a-b)}{3} \end{aligned}$$

(5) $\iint_D xy dx dy$, $D: xy = a, xy = b, y^2 = cx, y^2 = dx$ 围成的第一象限部分
($0 < a < b, 0 < c < d$)

(5) 解:

$$\begin{aligned} \text{let } u &= xy, v = \frac{y^2}{x}, \quad a < u < b, \quad c < v < d \\ dxdy &= \frac{dudv}{\left| \frac{\partial(u,v)}{\partial(x,y)} \right|} = \frac{dudv}{\left\| \begin{pmatrix} y & x \\ -\frac{y^2}{x^2} & \frac{2y}{x} \end{pmatrix} \right\|} = \frac{dudv}{3 \left| \frac{y^2}{x} \right|} = \frac{dudv}{3v} \\ I &= \iint_{D'} u \frac{dudv}{3v} = \int_a^b du \int_c^d u \frac{dv}{3v} \\ &= \int_a^b \left(\frac{u}{3} \ln \frac{d}{c} \right) du = \frac{b^2 - a^2}{6} \ln \frac{d}{c} \end{aligned}$$

(6) $\iint_D 4xy \, dx \, dy$, $D: x^4 + y^4 \leq 1, x \geq 0, y \geq 0$ 围成的区域;(6) 解: 令 $u = x^2, v = y^2$, 则 $du \, dv = 4xy \, dx \, dy$, 而区域变为 $u^2 + v^2 \leq 1, u, v \geq 0$. 所以

$$I = \iint_{u^2+v^2 \leq 1, u, v \geq 0} du \, dv = \frac{\pi}{4}.$$

(7) $\iint_D \frac{x^2 - y^2}{\sqrt{x+y+3}} \, dx \, dy$, $D: |x| + |y| \leq 1$;(7) 解: 令 $u = x + y, v = x - y$, 则 $dx \, dy = \frac{1}{2} du \, dv$, 且区域化为 $-1 \leq u, v \leq 1$. 于是

$$I = \int_{-1}^1 du \int_{-1}^1 \frac{uv}{2\sqrt{u+3}} \, dv = 0,$$

因为内层被积函数关于 v 为奇函数。(8) $\iint_D \sin \frac{y}{x+y} \, dx \, dy$, D : 由直线 $x + y = 1, x = 0, y = 0$ 围成的区域.(8) 解: let $u = x + y, v = \frac{y}{x+y}$, $dxdy = ududv$

$$\begin{aligned} I &= \int_0^1 dv \int_0^1 (u \sin v) du \\ &= \int_0^1 \left(\frac{1}{2} \sin v \right) dv \\ &= \left(-\frac{1}{2} \cos v \right) \Big|_0^1 = -\frac{1}{2} \cos 1 + \frac{1}{2} \end{aligned}$$

(9) $\iint_D |xy| \, dx \, dy, D = \{(x, y) : x^2 + y^2 \leq a^2\}$ (9) 解: let $x = r \cos \theta, y = r \sin \theta$,

$$\begin{aligned} I &= 4 \int_0^{\frac{\pi}{2}} d\theta \int_0^a r^2 \sin \theta \cos \theta r \, dr \, d\theta \\ &= 2 \int_0^{\frac{\pi}{2}} \left(\sin 2\theta \left(\frac{r^4}{4} \Big|_0^a \right) \right) d\theta \\ &= \frac{a^4}{2} \int_0^{\frac{\pi}{2}} \sin 2\theta \, d\theta = \frac{a^4}{4} (-\cos 2\theta) \Big|_0^{\frac{\pi}{2}} = \frac{a^4}{2} \end{aligned}$$

3. 求下列曲线所围成的平面区域的面积: (1) $x^2 + 2y^2 = 3$ 和 $xy = 1$ (不含原点部分);

$$(1) \text{ 解: } \because \begin{cases} x^2 + 2y^2 = 3 \\ xy = 1 \end{cases} \Rightarrow \begin{cases} x = \pm 1 \\ y = \pm 1 \end{cases} \quad \text{或} \quad \begin{cases} x = \pm \sqrt{2} \\ y = \pm \frac{\sqrt{2}}{2} \end{cases}$$

$$\begin{aligned} I_1 &= \int_1^{\sqrt{2}} \left(\sqrt{\frac{3-x^2}{2}} - \frac{1}{x} \right) dx \\ &= \left(\frac{1}{2\sqrt{2}} \left(x\sqrt{3-x^2} + 3 \arcsin \left(\frac{x}{\sqrt{3}} \right) \right) - \ln x \right) \Big|_1^{\sqrt{2}} \\ &= \frac{3\sqrt{2}}{4} \left(\arcsin \frac{\sqrt{2}}{\sqrt{3}} - \arcsin \frac{1}{\sqrt{3}} \right) - \ln \sqrt{2} \\ S &= 2I_1 = \frac{3\sqrt{2}}{2} \left(\arcsin \sqrt{\frac{2}{3}} - \arcsin \frac{1}{\sqrt{3}} \right) - \ln 2 \end{aligned}$$

方法二: 令 $x = r \cos \theta, y = r \sin \theta / \sqrt{2}$. 第一象限内该区域满足

$$\arctan \frac{1}{\sqrt{2}} \leq \theta \leq \arctan \sqrt{2}, \quad \frac{2\sqrt{2}}{\sin 2\theta} \leq r^2 \leq 3, \quad \iint dx dy = \frac{r}{\sqrt{2}} dr d\theta.$$

按此积分可得到与方法一相同的面积。

$$(2) (x-y)^2 + x^2 = a^2 (a > 0)$$

(2) 解: 令 $u = x, v = x - y$, 则 $|\partial(x, y)/\partial(u, v)| = 1$, 区域化为圆盘 $u^2 + v^2 \leq a^2$. 故所围面积为

$$S = \iint_{u^2+v^2 \leq a^2} du dv = \pi a^2.$$

(3) 由直线 $x + y = a, x + y = b, y = kx$ 和 $y = mx (0 < a < b, 0 < k < m)$ 围成的平面区域.

(3) 解: 令 $u = x + y, v = y/x$, 则 $x = u/(1+v), y = uv/(1+v)$, 且

$$dx dy = \frac{u}{(1+v)^2} du dv.$$

因此

$$S = \int_k^m dv \int_a^b \frac{u}{(1+v)^2} du = \frac{b^2 - a^2}{2} \left(\frac{1}{k+1} - \frac{1}{m+1} \right).$$

4. 证明

$$\iint_{x^2+y^2 \leq 1} e^{x^2+y^2} dx dy \leq \left[\int_{-\frac{\sqrt{\pi}}{2}}^{\frac{\sqrt{\pi}}{2}} e^{x^2} dx \right]^2$$

证明 记 $D = \{(x, y) \mid x^2 + y^2 \leq 1\}$, $D' = \{(x, y) \mid -\frac{\sqrt{\pi}}{2} \leq x \leq \frac{\sqrt{\pi}}{2}, -\frac{\sqrt{\pi}}{2} \leq y \leq \frac{\sqrt{\pi}}{2}\}$, $D_0 = D \cap D'$ 不等式的右边也可写成一个二重积分, 即

$$\left(\int_{-\frac{\sqrt{\pi}}{2}}^{\frac{\sqrt{\pi}}{2}} e^{x^2} dx \right)^2 = \int_{-\frac{\sqrt{\pi}}{2}}^{\frac{\sqrt{\pi}}{2}} e^{x^2} dx \int_{-\frac{\sqrt{\pi}}{2}}^{\frac{\sqrt{\pi}}{2}} e^{y^2} dy = \iint_{D'} e^{x^2+y^2} dx dy.$$

因为 D 与 D' 的面积都等于 π , 设 D_0 的面积为 A ($0 < A < \pi$), 则 $D \setminus D_0$ 与 $D' \setminus D_0$ 的面积都是 $\pi - A$. 在 $D \setminus D_0$ 上有 $x^2 + y^2 \leq 1$, 且除边界外严格小于 1, 则

$$\iint_{D \setminus D_0} e^{x^2+y^2} dx dy < \iint_{D \setminus D_0} e dx dy = e(\pi - A).$$

而在 $D' \setminus D_0$ 上有 $x^2 + y^2 \geq 1$, 且除边界外严格大于 1, 则

$$\iint_{D' \setminus D_0} e^{x^2+y^2} dx dy > \iint_{D' \setminus D_0} e dx dy = e(\pi - A).$$

故

$$\begin{aligned} \iint_{D \setminus D_0} e^{x^2+y^2} dx dy &< e(\pi - A) < \iint_{D' \setminus D_0} e^{x^2+y^2} dx dy \\ \iint_D e^{x^2+y^2} dx dy &< \iint_{D'} e^{x^2+y^2} dx dy = \left(\int_{-\frac{\sqrt{\pi}}{2}}^{\frac{\sqrt{\pi}}{2}} e^{x^2} dx \right)^2 \end{aligned}$$

□

5. 设 $f(x)$ 在 $[0, 1]$ 上连续, 证明 $\int_0^1 e^{f(x)} dx \cdot \int_0^1 e^{-f(y)} dy \geq 1$.

5. 证明: 联想概率积分计算方法

Question: $I = \int_a^b e^{-f(x)} dx \int_a^b e^{f(y)} dy \geq (b-a)^2, f \in C$

proof : $I = \iint_{[a,b]^2} e^{f(y)-f(x)} d\sigma$

$$I = \int_a^b e^{-f(y)} dy \int_a^b e^{f(x)} dx = \iint_{[a,b]^2} e^{f(x)-f(y)} d\sigma$$

$$2I = \iint_{[a,b]^2} [e^{f(x)-f(y)} + e^{f(y)-f(x)}] d\sigma$$

$$\geq \int_{[a,b]^2} 2d\sigma = 2(b-a)^2, \therefore I \geq (b-a)^2$$

$$\therefore I = \int_0^1 e^{-f(x)} dx \int_0^1 e^{f(y)} dy \geq 1, f \in C$$

□

6. 设 $f(x)$ 为连续的奇函数, 证: $\iint_{|x|+|y|\leq 1} e^{f(x+y)} dx dy \geq 2$.

Proof: $I = \iint_{|x|+|y|\leq a} e^{f(x+y)} d\sigma \geq 2a^2$,

let $x + y = u$, $x - y = v$, $-a \leq u, v \leq a$, $d\sigma = dx dy = \frac{dv du}{2}$

$$\begin{aligned} I &= \int_{-a}^a \int_{-a}^a e^{f(u)} \frac{dv du}{2} = a \int_{-a}^a e^{f(u)} du = a \int_{-a}^0 e^{f(u)} du + a \int_0^a e^{f(u)} du \\ &= a \int_0^a (e^{-f(u)} + e^{f(u)}) du \geq 2a^2 \quad (a=1 \text{ 可推出题干不等式}) \end{aligned}$$

□

7. 设 $f(t)$ 为连续函数, 求证 $\iint_D f(x-y) dx dy = \int_{-A}^A f(t)(A-|t|) dt$ 其中 D 为: $|x| \leq \frac{A}{2}, |y| \leq \frac{A}{2}, A > 0$ 为常数.

证明: 难点在于交换积分顺序, 并且绘制 t - x 积分域

$$\begin{aligned} \iint_D f(x-y) dx dy &= \int_{-\frac{A}{2}}^{\frac{A}{2}} dx \int_{-\frac{A}{2}}^{\frac{A}{2}} f(x-y) dy, \text{ let } x-y=t. \\ \int_{-\frac{A}{2}}^{\frac{A}{2}} dx \int_{x-\frac{A}{2}}^{x+\frac{A}{2}} f(t) dt &= \int_{-A}^0 f(t) dt \int_{-\frac{A}{2}}^{t+\frac{A}{2}} dx + \int_0^A f(t) dt \int_{t-\frac{A}{2}}^{\frac{A}{2}} dx \\ &= \int_{-A}^0 f(t)(A+t) dt + \int_0^A f(t)(A-t) dt = \int_{-A}^A f(t)(A-|t|) dt \end{aligned}$$

□

10.3 习题 三重积分

1. 计算下列三重积分.

$$(1) \iiint_V xy \, dx \, dy \, dz, \quad V: 1 \leq x \leq 2, -2 \leq y \leq 1, 0 \leq z \leq \frac{1}{2};$$

$$1. (1) \text{ 解: } I = \iiint_V xy \, dx \, dy \, dz = \left(\int_1^2 x \, dx \right) \left(\int_{-2}^1 y \, dy \right) \left(\int_0^{1/2} dz \right) = -\frac{9}{8}$$

$$(2) \iiint_V xy^2 z^3 \, dx \, dy \, dz, \quad V: \text{由 } z = xy, y = x, x = 1, z = 0 \text{ 围成};$$

$$(2) \text{ 解: } I = \int_0^1 dx \int_0^x dy \int_0^{xy} xy^2 z^3 dz = \int_0^1 dx \int_0^x \frac{1}{4} x^5 y^6 dy = \int_0^1 \frac{x^{12}}{28} dx = \frac{1}{364}$$

$$(3) \iiint_V y \cos(x+z) \, dx \, dy \, dz, \quad V: \text{由 } y = \sqrt{x}, y = 0, z = 0, x+z = \frac{\pi}{2} \text{ 围成};$$

$$\begin{aligned} I &= \iint_{D_{xz}} dx \, dz \int_0^{\sqrt{x}} y \cos(x+z) \, dy \\ (3) \text{ 解: } &= \frac{1}{2} \int_0^{\pi/2} x \, dx \int_0^{\pi/2-x} \cos(x+z) \, dz \\ &= \frac{1}{2} \int_0^{\pi/2} x(1 - \sin x) \, dx = \frac{\pi^2}{16} - \frac{1}{2}. \end{aligned}$$

$$(4) \iiint_V (a-y) \, dx \, dy \, dz, \quad V: \text{由 } y = 0, z = 0, 2x+y=a, x+y=a, y+z=a \text{ 围成}.$$

$$\begin{aligned} I &= \int_0^a dy \int_0^{a-y} dz \int_{\frac{a-y}{2}}^{a-y} (a-y) \, dx \\ (4) \text{ 解: } &= \int_0^a \frac{1}{2} (a-y)^3 \, dy = - \int_a^0 \frac{1}{2} u^3 \, du \\ &= \int_0^a \frac{1}{2} u^3 \, du = \frac{u^4}{8} \Big|_0^a = \frac{a^4}{8} \end{aligned}$$

2. 计算下列积分值.

$$(1) \int_0^2 dx \int_0^{\sqrt{2x-x^2}} dy \int_0^a z \sqrt{x^2+y^2} \, dz;$$

$$\begin{aligned} I &= \int_0^2 dx \int_0^{\sqrt{2x-x^2}} \frac{a^2 \sqrt{x^2+y^2}}{2} \, dy = \frac{a^2}{2} \int_0^{\frac{\pi}{2}} d\theta \int_0^{2 \cos \theta} r^2 \, dr \\ 2(1) \text{ 解: } &= \frac{1}{2} a^2 \int_0^{\frac{\pi}{2}} \frac{8}{3} \cos^3 \theta \, d\theta = \frac{4a^2}{3} \times \frac{2}{3} = \frac{8a^2}{9} \end{aligned}$$

$$(2) \int_{-R}^R dx \int_{-\sqrt{R^2-x^2}}^{\sqrt{R^2-x^2}} dy \int_0^{\sqrt{R^2-x^2-y^2}} (x^2+y^2) \, dz;$$

(2) 解: 采用柱坐标,

$$I = 2\pi \int_0^R r^3 \sqrt{R^2 - r^2} dr = \frac{4\pi R^5}{15}.$$

$$(3) \int_0^1 dx \int_0^{\sqrt{1-x^2}} dy \int_0^{\sqrt{1-x^2-y^2}} \sqrt{x^2+y^2+z^2} dz;$$

解:

$$\begin{aligned} (3) I &= \int_0^{\frac{\pi}{2}} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^1 r \cdot r^2 \sin \theta dr \\ &= \frac{\pi}{2} \cdot \frac{1}{4} = \frac{\pi}{8} \end{aligned}$$

$$(4) \int_0^1 dx \int_0^{\sqrt{1-x^2}} dy \int_{\sqrt{x^2+y^2}}^{\sqrt{2-x^2-y^2}} z^2 dz.$$

(4) 解:

$$\begin{aligned} I &= \int_0^{\frac{\pi}{2}} d\theta \int_0^1 r dr \int_r^{\sqrt{2-r^2}} z^2 dz \\ &= \frac{\pi}{6} \int_0^1 r [(2-r^2)^{3/2} - r^3] dr = \frac{\pi(2\sqrt{2}-1)}{15}. \end{aligned}$$

3. 计算下列三重积分. (1) $\iiint_V (x^2 + y^2) dx dy dz$, V : 由 $x^2 + y^2 = 2z, z = 2$ 围成;

$$\begin{aligned} I &= \iiint r^2 \cdot r dr d\theta dz = 2\pi \int_0^2 dz \int_0^{\sqrt{2z}} r^3 dr \\ &= 2\pi \int_0^2 \frac{4z^2}{4} dz = \frac{16\pi}{3}, \end{aligned}$$

3(1) 解:

$$(2) I = \int_0^{2\pi} d\theta \int_0^1 dz \int_0^z r \cdot r dr = 2\pi \int_0^1 \frac{z^3}{3} dz = 2\pi \cdot \frac{1}{12} = \frac{\pi}{6}$$

(2) 解: $\iiint_V \sqrt{x^2 + y^2} dx dy dz$, V : 由 $x^2 + y^2 = z^2, z = 1$ 围成;

$$(2) I = \int_0^{2\pi} d\theta \int_0^1 dz \int_0^z r \cdot r dr = 2\pi \int_0^1 \frac{z^3}{3} dz = 2\pi \cdot \frac{1}{12} = \frac{\pi}{6}$$

(3) $\iiint_V z dx dy dz$, V : 由 $\sqrt{4-x^2-y^2} = z, x^2 + y^2 = 3z$ 围成;

$$\begin{aligned}
 (1) \quad 0 \leq z \leq 1, \quad I_1 &= \int_0^{2\pi} d\theta \int_0^1 z dz \int_0^{\sqrt{3z}} r dr = 2\pi \int_0^1 \frac{3z^2}{2} dz = \pi \\
 (2) \quad 1 \leq z \leq 2, \quad I_2 &= \int_0^{2\pi} d\theta \int_1^2 z dz \int_0^{\sqrt{4-z^2}} r dr \\
 (3) \text{ 解:} \quad &= 2\pi \int_1^2 \frac{1}{2} z (4 - z^2) dz = \pi \int_1^2 (4z - z^3) dz = \frac{9\pi}{4} \\
 \therefore I &= I_1 + I_2 = \frac{13\pi}{4}
 \end{aligned}$$

(4) $\iiint_V xyz \, dx \, dy \, dz$, V : 是 $x^2 + y^2 + z^2 \leq 1$ 的第一卦限部分;

$$\begin{aligned}
 I &= \int_0^{\frac{\pi}{2}} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^1 r^3 \sin^2 \theta \cos \theta \sin \varphi \cos \varphi \cdot r^2 \sin \theta dr \\
 (4) \text{ 解:} \quad &= \left(\int_0^{\frac{\pi}{2}} \sin \varphi \cos \varphi d\varphi \right) \cdot \left(\int_0^{\frac{\pi}{2}} \sin^3 \theta \cos \theta d\theta \right) \cdot \left(\int_0^1 r^5 dr \right) \\
 &= \frac{1}{2} \times \frac{1}{4} \times \frac{1}{6} = \frac{1}{48}
 \end{aligned}$$

(5) $\iiint_V x^2 \, dx \, dy \, dz$, V : 是由曲面 $z = y^2, z = 4y^2 (y > 0)$ 及平面 $z = x, z = 2x, z = 1$ 所围的区域;

(5) 解:

$$\begin{aligned}
 u &= \frac{z}{y^2}, v = \frac{z}{x}, \quad z = w, \quad x = \frac{w}{v}, y = \sqrt{\frac{w}{u}}, \quad z = w, \\
 D' : \quad &1 \leq u \leq 4, 1 \leq v \leq 2, \quad 0 \leq w \leq 1 \\
 \left| \frac{\partial(u, v, w)}{\partial(x, y, z)} \right| &= \begin{vmatrix} 0 & -\frac{w}{v^2} & \frac{1}{v} \\ \frac{-\sqrt{w}}{2u\sqrt{u}} & 0 & \frac{1}{2\sqrt{uw}} \\ 0 & 0 & 1 \end{vmatrix} = \frac{-w\sqrt{w}}{2u\sqrt{uv^2}} \\
 \therefore I &= \int_0^1 w^{\frac{7}{2}} dw \int_1^2 \frac{dv}{v^4} \int_1^4 \frac{1}{2u\sqrt{u}} du = \frac{7}{216}
 \end{aligned}$$

(6) $\iiint_V |x^2 + y^2 + z^2 - 1| \, dx \, dy \, dz$, $V: x^2 + y^2 + z^2 \leq 4$.

(6) 解: 球对称性给出

$$\begin{aligned}
 I &= 4\pi \left[\int_0^1 (1 - r^2) r^2 dr + \int_1^2 (r^2 - 1) r^2 dr \right] \\
 &= \frac{8\pi}{15} + \frac{232\pi}{15} = 16\pi.
 \end{aligned}$$

(7) $\iiint_V e^{|z|} \, dx \, dy \, dz$, $V: x^2 + y^2 + z^2 \leq 1$;

(7) 解: 按与 z 垂直的截面分层,

$$I = 2\pi \int_0^1 e^z (1 - z^2) dz = 2\pi.$$

$$(8) \iiint_V (|x| + z) e^{-(x^2+y^2+z^2)} dx dy dz, \quad V: 1 \leq x^2 + y^2 + z^2 \leq 4$$

解: ze^{-r^2} 关于 z 为奇函数, 其积分为零。又

$$\int_{S^2} |\sin \theta \cos \varphi| d\Omega = 2\pi,$$

故

$$I = 2\pi \int_1^2 r^3 e^{-r^2} dr = 2\pi \left(\frac{1}{e} - \frac{5}{2e^4} \right).$$

4. 利用对称性求下列三重积分. (1) $\iiint_V (x + y) dx dy dz$, V : 由 $z = 1 - x^2 - y^2$ 和 $z = 0$ 围成;

$$4(1) \text{ 解: } I = 2 \iiint_V x dx dy dz = 0$$

(2) $\iiint_V x dx dy dz$, V : 由 $x^2 + y^2 = z^2, x^2 + y^2 = 1$ 围成;

$$\begin{aligned} (2) \text{ 解: } I &= 2 \int_0^1 dz \int_0^{2\pi} d\theta \int_z^1 r \cos \theta \cdot r dr \\ &= 2 \int_0^1 dz \int_0^{2\pi} \frac{1 - z^3}{3} \cos \theta d\theta = 0 \end{aligned}$$

(3) $\iiint_V \sqrt{x^2 + y^2 + z^2} dx dy dz$, $V: x^2 + y^2 + z^2 \leq x$;

$$\begin{aligned} (3) \text{ 解: } I &= \int_{-\pi/2}^{\pi/2} d\varphi \int_0^\pi d\theta \int_0^{\sin \theta \cos \varphi} r^3 \sin \theta dr \\ &= \frac{1}{4} \left(\int_{-\pi/2}^{\pi/2} \cos^4 \varphi d\varphi \right) \left(\int_0^\pi \sin^5 \theta d\theta \right) = \frac{\pi}{10}. \end{aligned}$$

(4) $\iiint_V (x^2 + y^2) dx dy dz$, $V: r^2 \leq x^2 + y^2 + z^2 \leq R^2, z \geq 0$;

$$\begin{aligned} (4) \text{ 解: } I &= \frac{1}{3} \iiint_V (2x^2 + 2y^2 + 2z^2) dx dy dz = \frac{2}{3} \iiint_V (x^2 + y^2 + z^2) dx dy dz \\ &= \frac{2}{3} \int_0^{2\pi} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^R r^2 \cdot r^2 \sin \theta dr \\ &= \frac{4\pi}{3} \left(\int_0^{\frac{\pi}{2}} \sin \theta d\theta \right) \left(\int_0^R r^4 dr \right) = \frac{4\pi}{3} \cdot \frac{R^5 - r^5}{5} = \frac{4\pi (R^5 - r^5)}{15} \end{aligned}$$

(5)

$$\iiint_V \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2}} \, dx \, dy \, dz, \quad V: \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \leq 1;$$

(5) 解: $I = 4\pi abc \int_0^1 r^2 \sqrt{1-r^2} \, dr$
 $= 4\pi abc \cdot \frac{\pi}{16} = \frac{\pi^2 abc}{4}.$

(6)

$$\iiint_V \frac{z \ln(x^2 + y^2 + z^2 + 1)}{x^2 + y^2 + z^2 + 1} \, dx \, dy \, dz, \quad V: x^2 + y^2 + z^2 \leq 1$$

(6) 解: $I = \int_0^{2\pi} d\varphi \int_0^\pi d\theta \int_0^1 \frac{r \cos \theta \ln(r^2 + 1)}{r^2 + 1} dr^2 \sin \theta dr$
 $= 2\pi \left(\int_0^\pi \sin \theta \cos \theta d\theta \right) \left(\int_0^1 \frac{r^3 \ln(r^2 + 1)}{r^2 + 1} dr \right) = 0$

(也可以应用 z 的奇函数性质加对称性说明为 0)

5. 计算下列曲面围成的立体体积.

(1) $y = 0, z = 0, 3x + y = 6, 3x + 2y = 12, x + y + z = 6;$

$$\begin{aligned} I &= \int_0^6 dy \int_{2-\frac{y}{3}}^{4-\frac{2y}{3}} dx \int_0^{6-x-y} dz \\ &= \int_0^6 dy \int_{2-\frac{y}{3}}^{4-\frac{2y}{3}} (6-x-y) dx \\ 5.(1) \text{ 解: } &= \int_0^6 \left[(6-y)x - \frac{1}{2}x^2 \right] \Big|_{2-\frac{y}{3}}^{4-\frac{2y}{3}} dy \\ &= \int_0^6 \frac{(6-y)^2}{6} dy = \int_{-6}^0 \frac{t^2}{6} dt \\ &= \frac{t^3}{18} \Big|_{-6}^0 = 12 \end{aligned}$$

(2) $z = x^2 + y^2, z = 2x^2 + 2y^2, y = x, y = x^2;$

$$(2) I = \int_0^1 dx \int_{x^2}^x dy \int_{x^2+y^2}^{2(x^2+y^2)} dz$$

$$= \int_0^1 dx \int_{x^2}^x (x^2 + y^2) dy$$

解: $= \int_0^1 -x^2(x^2 - x) + \frac{-x^6 + x^3}{3} dx$

$$= \int_0^1 \left(\frac{-x^6}{3} + \frac{4x^3}{3} - x^4 \right) dx = \left(-\frac{x^7}{21} + \frac{x^4}{3} - \frac{x^5}{5} \right) \Big|_0^1$$

$$= \frac{3}{35}$$

(3) $z^2 + x^2 = 1$ 和 $x + y + z = 3, y = 0$;

$$z = r \cos \theta, x = r \sin \theta, \quad 0 \leq y \leq 3 - x - z = 3 - r(\sin \theta + \cos \theta),$$

$$I = \int_0^{2\pi} d\theta \int_0^1 r dr \int_0^{3-r(\sin \theta + \cos \theta)} dy$$

(3) 解: $= \int_0^{2\pi} d\theta \int_0^1 [3r - r^2(\sin \theta + \cos \theta)] dr$

$$= \int_0^{2\pi} \left[\frac{3}{2} - \frac{1}{3}(\sin \theta + \cos \theta) \right] d\theta = 3\pi$$

(4) $x^2 + y^2 = 2x, z = x^2 + y^2, z = 0$;

(4) 解: $(x-1)^2 + y^2 = 1, x = r \cos \theta + 1, y = r \sin \theta, \quad 0 \leq r \leq 1, 0 \leq z \leq x^2 + y^2 = r^2 + 1 + 2r \cos \theta$

$$I = \int_0^{2\pi} d\theta \int_0^1 dr \int_0^{r^2+2r \cos \theta + 1} r dz = \int_0^{2\pi} d\theta \int_0^1 (r^2 + 2r \cos \theta + 1) r dr$$

$$= \int_0^{2\pi} \left(\frac{1}{4} + \frac{2 \cos \theta}{3} + \frac{1}{2} \right) d\theta = \frac{3\pi}{2}$$

(5) $\frac{x^2}{9} + \frac{y^2}{4} = 1, z = xy$ (在第一卦限部分);

$$x = 3r \cos \theta, \quad y = 2r \sin \theta, \quad 0 \leq z \leq 6r^2 \sin \theta \cos \theta, \quad 0 \leq \theta \leq \frac{\pi}{2},$$

(5) 解: $I = \int_0^{\frac{\pi}{2}} d\theta \int_0^1 6r dr \int_0^{6r^2 \sin \theta \cos \theta} dz$

$$= \int_0^{\frac{\pi}{2}} d\theta \int_0^1 36r^3 \sin \theta \cos \theta dr = \int_0^{\frac{\pi}{2}} 9 \sin \theta \cos \theta d\theta = \frac{9}{2}$$

(6) $x^2 + y^2 + z^2 = 2az, x^2 + y^2 = z^2$ (含 z 轴部分);

$$I = \int_0^{2\pi} d\varphi \int_0^{\frac{\pi}{4}} \sin \theta d\theta \int_0^{2a \cos \theta} r^2 dr$$

(6) 解: $= 2\pi \int_0^{\frac{\pi}{4}} \frac{8}{3} a^3 \cos^3 \theta \sin \theta d\theta$

$$= \pi a^3$$

$$(7) \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2} \text{ (含 } z \text{ 轴部分)};$$

(7) 解: 取椭球坐标 $x = ar \sin \theta \cos \varphi, y = br \sin \theta \sin \varphi, z = cr \cos \theta$. 含 z 轴的部分对应 $0 \leq \theta \leq \pi/4$ 与 $3\pi/4 \leq \theta \leq \pi$, 故

$$I = \frac{4\pi abc}{3} \left(1 - \frac{\sqrt{2}}{2}\right).$$

$$(8) (x^2 + y^2 + z^2)^2 = a^3 x.$$

(8) 解: $r^3 \leq a^3 \sin \theta \cos \varphi$, 其中 $-\pi/2 \leq \varphi \leq \pi/2$. 所以

$$I = \frac{a^3}{3} \int_{-\pi/2}^{\pi/2} \cos \varphi d\varphi \int_0^\pi \sin^2 \theta d\theta = \frac{\pi a^3}{3}.$$

6. 求函数 $f(x, y, z) = x^2 + y^2 + z^2$ 在域 $x^2 + y^2 + z^2 \leq x + y + z$ 内的平均值.

6. 解: 该区域是以 $(1/2, 1/2, 1/2)$ 为球心、半径 $R = \sqrt{3}/2$ 的球. 令 $(u, v, w) = (x, y, z) - (1/2, 1/2, 1/2)$. 对称性使一次项的平均值为零, 而球内 $u^2 + v^2 + w^2$ 的平均值为 $3R^2/5$. 故所求平均值为

$$\frac{3}{4} + \frac{3R^2}{5} = \frac{3}{4} + \frac{9}{20} = \frac{6}{5}.$$

7. 设 $F(t) = \iiint_{x^2+y^2+z^2 \leq t^2} f(x^2 + y^2 + z^2) dx dy dz$, 其中 f 为可微分函数, 求 $F'(t)$.

7. 解:

$$\begin{aligned} F(t) &= \int_0^{2\pi} \int_0^\pi \int_0^t f(r^2) r^2 \sin \theta dr d\theta d\varphi \\ &= 4\pi \int_0^t f(r^2) r^2 dr, \quad F'(t) = 4\pi t^2 f(t^2) \end{aligned}$$

8. 证明:

$$\iiint_{x^2+y^2+z^2 \leq 1} f(z) dv = \pi \int_{-1}^1 f(z) (1 - z^2) dz.$$

8. 证明:

$$\iiint_{x^2+y^2+z^2 \leq 1} f(z) dV = \int_{-1}^1 dz \iint_{x^2+y^2 \leq 1-z^2} f(z) dx dy = \int_{-1}^1 \pi (1 - z^2) f(z) dz.$$

□

9. 设函数 $f(x, y, z)$ 连续, 证明:

$$\int_a^b dx \int_a^x dy \int_a^y f(x, y, z) dz = \int_a^b dz \int_z^b dy \int_y^b f(x, y, z) dx$$

9. 证明: $\because a \leq z \leq y \leq x \leq b$,

$$\begin{aligned} \int_a^b dx \int_a^x dy \int_a^y f(x, y, z) dz &= \int_a^b dx \int_a^x dz \int_z^x f(x, y, z) dy \\ &= \int_a^b dz \int_z^b dx \int_z^x f(x, y, z) dy = \int_a^b dz \int_z^b dy \int_y^b f(x, y, z) dx \end{aligned}$$

□

10. 求椭圆薄片 $\frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1$ 的质量, 设密度 $\rho = \frac{x^2}{a^2} + \frac{y^2}{b^2}$.

10. 解:

$$\begin{aligned} m &= \iint_{\frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1} \rho dx dy = \iint_{\frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1} \left(\frac{x^2}{a^2} + \frac{y^2}{b^2} \right) dx dy \\ &= \int_0^{2\pi} \int_0^1 r^2 \cdot a b r dr d\theta = \frac{\pi a b}{2} \end{aligned}$$

11. 一个平面圆环是由半径为 R 和 r ($R > r$) 的两个同心圆所围成的, 已知材料各点的密度和到圆心的距离成反比, 并在内圆的圆周上密度为 1, 求环的质量.

11. 解:

$$\begin{aligned} m &= \iint \sigma ds = \int_0^{2\pi} d\theta \int_r^R \frac{r}{s} s ds \\ &= 2\pi r(R - r). \end{aligned}$$

12. 一个物体是由两个半径各为 R 和 r ($R > r$) 的同心球所围成, 已知材料的密度和到球心的距离成反比, 且在距离等于 1 处的密度等于 k , 求物体的总质量.

解: 以 s 表示到球心的距离, 则密度 $\rho(s) = k/s$. 因此

$$m = \int_0^{2\pi} d\varphi \int_0^\pi \sin \theta d\theta \int_r^R \frac{k}{s} s^2 ds = 2\pi k(R^2 - r^2).$$

13. 半径为 a 的圆盘, 其各点的密度和到圆心的距离成正比 (比例系数为 1), 今内切于圆盘截去半径为 $\frac{a}{2}$ 之小圆, 求余下部分的重心坐标.

13. 解: 不妨设被截小圆位于 x 轴正向. 原圆盘质量为 $2\pi a^3/3$; 小圆在极坐标中为 $-\pi/2 \leq \theta \leq \pi/2, 0 \leq r \leq a \cos \theta$, 故其质量为 $4a^3/9$, 关于 y 轴的一阶矩为 $4a^4/15$. 因此余下部分的重心为

$$(x_G, y_G) = \left(-\frac{4a^4/15}{2\pi a^3/3 - 4a^3/9}, 0 \right) = \left(-\frac{6a}{5(3\pi - 2)}, 0 \right).$$

14. 有一个匀质薄板, 它是由半径为 a 的半圆和一个长方形拼接而成, 为了使重心正好在圆心上, 问长方形的宽 b 应为多少?

14. 解: 取半圆在 $x \leq 0$ 、长方形在 $0 \leq x \leq b$ 。令关于 y 轴的一阶矩为零:

$$\begin{aligned} 0 &= \int_{-a}^a dy \int_{-\sqrt{a^2-y^2}}^0 x dx + \int_{-a}^a dy \int_0^b x dx \\ &= -\frac{2a^3}{3} + ab^2. \end{aligned}$$

故 $b = a\sqrt{2/3} = \sqrt{6}a/3$ 。

15. 求由曲面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2}$ 和 $z = c$ 所围成的均匀物体的重心坐标。

15. 解:

$$z_G = \frac{\int_0^c z \rho \pi ab \frac{z^2}{c^2} dz}{\int_0^c \rho \pi ab \frac{z^2}{c^2} dz} = \frac{3c}{4}, \left(0, 0, \frac{3c}{4}\right)$$

16. 设球体 $x^2 + y^2 + z^2 \leq 2az$ 内各点密度与各点到原点的距离成反比, 求其重心坐标。

16. 解:

$$z_G = \frac{\iiint_0 z dV}{\iiint_0 dV} = \frac{\int_0^{2\pi} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^{2a \cos \theta} r^2 \cos \theta \sin \theta dr}{\int_0^{2\pi} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^{2a \cos \theta} r \sin \theta dr} = \frac{\frac{16}{15} \pi a^3}{\frac{4}{3} \pi a^2} = \frac{4}{5} a. \left(0, 0, \frac{4}{5} a\right)$$

17. 在半径为 a 的圆柱上连接一个半径为 a 的半球, 为了使重心正好在球心上, 问圆柱之高如何?

17. 解: 以球心为原点, 半球在 $z \geq 0$ 、圆柱在 $-h \leq z \leq 0$ 。重心在原点等价于

$$\pi \int_0^a z(a^2 - z^2) dz + \pi a^2 \int_{-h}^0 z dz = \frac{\pi a^4}{4} - \frac{\pi a^2 h^2}{2} = 0.$$

故 $h = a/\sqrt{2}$ 。

18. 求以下各物体的转动惯量 (设 $\rho = \text{常数}$) (1) 质量为 m , 半径为 R 的薄圆盘, 对于: (a) 通过圆心并垂直圆盘的轴; (b) 直径. (2) 质量为 m , 半径为 R 的球体, 对于通过球心的轴线。

18. 解: 薄圆盘的面密度为 $\rho = m/(\pi R^2)$, 故

$$I_z = 2\pi \rho \int_0^R r^3 dr = \frac{1}{2} m R^2, \text{ 且 } I_D = \frac{1}{2} I_z = \frac{1}{4} m R^2.$$

均匀实心球的体密度为 $3m/(4\pi R^3)$, 因此对任一过球心的轴

$$I = \rho \int_0^R r^4 dr \int_0^\pi \sin^3 \theta d\theta \int_0^{2\pi} d\varphi = \frac{2}{5} m R^2.$$

19. 求密度为 ρ 的均匀球锥体对于在其顶点为一单位质量的质点的吸引力, 设球的半径为 R , 而轴截面的扇形的角等于 2α 。

解：横向分量由对称性相消。若万有引力常数为 G ，轴向分量为

$$F = G\rho \int_0^R dr \int_0^{2\pi} d\varphi \int_0^\alpha \cos\theta \sin\theta d\theta = \pi G\rho R \sin^2\alpha.$$

若采用 $G = 1$ 的单位制，去掉上式中的 G 。

10.4 习题 n 重积分

1. 计算下列 n 重积分.

$$(1) \int \cdots \int_{[0,1]^n} (x_1^2 + \cdots + x_n^2) dx_1 \cdots dx_n$$

解: (1) $\because \int \cdots \int_{[0,1]^n} (x_i^2) dx_1 dx_2 \cdots dx_n = \int \cdots \int_{[0,1]^{n-1}} \frac{1}{3} dx_1 dx_2 \cdots dx_{i-1} dx_{i+1} \cdots dx_n = \frac{1}{3}, \therefore I = \frac{n}{3}.$

$$(2) \int \cdots \int_{[0,1]^n} (x_1 + \cdots + x_n)^2 dx_1 \cdots dx_n$$

解:

$$(2) \because (x_1 + x_2 + \cdots + x_n)^2 = \sum_{i=1}^n x_i^2 + 2 \sum_{1 \leq i < j \leq n} x_i x_j, \text{ 而}$$

$$\int \cdots \int_{[0,1]^n} x_1 x_2 dx_1 dx_2 \cdots dx_n = \int_0^1 x_1 dx_1 \int_0^1 x_2 dx_2 \int_0^1 dx_3 \cdots \int_0^1 dx_n = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$$

$\sum_{1 \leq i < j \leq n} x_i x_j$ 共有 $(n-1) + (n-2) + \cdots + 1 = \frac{n(n-1)}{2}$ 项, 再由对称性, 有

$$\begin{aligned} \int_{[0,1]^n} \cdots \int (x_1 + x_2 + \cdots + x_n)^2 dx_1 dx_2 \cdots dx_n &= \int_{[0,1]^n} \cdots \int \left[\sum_{i=1}^n x_i^2 + 2 \sum_{1 \leq i < j \leq n} x_i x_j \right] dx_1 dx_2 \cdots dx_n \\ &= \frac{n}{3} + 2 \cdot \frac{n(n-1)}{2} \cdot \frac{1}{4} = \frac{n(3n+1)}{12} \end{aligned}$$

$$(3) \int_0^1 dx_1 \int_0^{x_1} dx_2 \cdots \int_0^{x_{n-1}} x_1 \cdots x_n dx_n$$

解: (3) 被积函数 $x_1 \cdots x_n$ 关于各变量对称, 而区域 $0 \leq x_n \leq \cdots \leq x_1 \leq 1$ 是立方体 $[0,1]^n$ 的 $n!$ 个全等部分之一。因此

$$I = \frac{1}{n!} \int_{[0,1]^n} x_1 \cdots x_n d\mathbf{x} = \frac{1}{n!} \left(\int_0^1 x dx \right)^n = \frac{1}{2^n n!}.$$

2. 计算下列集合 $V_n = \{(x_1, \dots, x_n) : \frac{x_1}{a_1} + \dots + \frac{x_n}{a_n} \leq 1, x_1, \dots, x_n \geq 0\}$ 的体积.

2. 解: let $x_i = a_i t_i, \quad i = 1, 2, \dots, n,$

$$\frac{\partial(x_1, x_2, \dots, x_n)}{\partial(t_1, t_2, \dots, t_n)} = \prod_{i=1}^n a_i, \sigma(s_n(a_i)) = \int_{s_n(a_i)} d\sigma = \left(\prod_{i=1}^n a_i\right) (S_n(1)).$$

注意到, 对于固定的 $t \in [0, 1], S_n(1)$ 与 $t_n = t$ 的截面是由满足 $t_1, t_2, \dots, t_{n-1} \geq 0, t_1 + t_2 + \dots + t_{n-1} \leq 1 - t$ 的点组成、边长为 $1 - t$ 的 $n - 1$ 维单形 $S_{n-1}(1 - t)$. 因此

$$\begin{aligned} \sigma(S_n(1)) &= \int_0^1 dt \int \cdots \int_{S_{n-1}(1-t)} dt_1 dt_2 \cdots dt_{n-1} = \int_0^1 \sigma(S_{n-1}(1-t)) dt \\ &= \int_0^1 (1-t)^{n-1} \sigma(S_{n-1}(1)) dt = \sigma(S_{n-1}(1)) \int_0^1 (1-t)^{n-1} dt \\ &= \frac{1}{n} \sigma(S_{n-1}(1)) \end{aligned}$$

这样就得到一个递推公式, 显然 $\sigma(S_1(1)) = 1$, 所以 $\sigma(S_n(a_i)) = \frac{\prod_{i=1}^n a_i}{n!}$

3. 设 $f(x)$ 连续, 证明:

$$\int_0^a dx_1 \int_0^{x_1} dx_2 \cdots \int_0^{x_{n-1}} f(x_n) dx_n = \frac{1}{(n-1)!} \int_0^a f(t)(a-t)^{n-1} dt$$

证明: 固定 $x_n = t$ 后, 其余变量组成单形

$$t \leq x_{n-1} \leq \cdots \leq x_1 \leq a,$$

其 $(n-1)$ 维体积为 $(a-t)^{n-1}/(n-1)!$. 由 Fubini 定理立即得到

$$J_n = \frac{1}{(n-1)!} \int_0^a f(t)(a-t)^{n-1} dt.$$

□

4. 设 $f(x)$ 连续, 证明:

$$\int_0^a dx_1 \int_0^{x_1} dx_2 \cdots \int_0^{x_{n-1}} f(x_1) f(x_2) \cdots f(x_n) dx_n = \frac{1}{n!} \left(\int_0^a f(t) dt \right)^n$$

4. 证明: 被积函数关于 $x_1, \dots, x_n$ 对称, 且有序单形 $0 \leq x_n \leq \cdots \leq x_1 \leq a$ 占立方体 $[0, a]^n$ 的 $1/n!$. 故

$$I = \frac{1}{n!} \int_{[0,a]^n} \prod_{j=1}^n f(x_j) d\mathbf{x} = \frac{1}{n!} \left(\int_0^a f(t) dt \right)^n.$$

□

10.5 第 10 章综合习题

1. 计算二重积分 $I = \iint_D \operatorname{sgn}(x^2 - y^2 + 2) dx dy$, 其中 $D = \{(x, y) : x^2 + y^2 \leq 4\}$

解 由对称性得

$$I = 4 \iint_D \operatorname{sgn}(y^2 - x^2 + 2) dx dy,$$

其中

$$D = \{(x, y) \mid x^2 + y^2 \leq 4, x \geq 0, y \geq 0\}.$$

两条曲线

$$\begin{cases} x^2 + y^2 = 4 \\ y^2 - x^2 + 2 = 0. \end{cases}$$

在第一象限的交点可解为 $y = 1, x = \sqrt{3}$. 曲线 $y^2 - x^2 + 2 = 0$ 将 D 分成两部分 $D = D_1 \cup D_2$:

$$D_1 = \{(x, y) \mid x^2 + y^2 \leq 4, y^2 - x^2 + 2 \geq 0, x \geq 0, y \geq 0\}$$

$$D_2 = \{(x, y) \mid x^2 + y^2 \leq 4, y^2 - x^2 + 2 \leq 0, x \geq 0, y \geq 0\}.$$

所以

$$\operatorname{sgn}(y^2 - x^2 + 2) = \begin{cases} 1 & (x, y) \in D_1 \\ -1 & (x, y) \in D_2 \end{cases}$$

$$\begin{aligned} \therefore \iint_D \operatorname{sgn}(x^2 - y^2 + 2) dx dy &= \iint_{D_1} dx dy - \iint_{D_2} dx dy \\ &= \sigma(D_1) - \sigma(D_2) = \sigma(D) - 2\sigma(D_2). \end{aligned}$$

这里 $\sigma(D)$ 是以 2 为半径的四分之一的圆的面积 $\sigma(D) = \pi$, $\sigma(D_2)$ 是曲线 $x^2 + y^2 = 4$ 和 $y^2 - x^2 + 2 = 0$ 在第一象限围成的面积. 为了计算 D_2 的面积, 令

$$x = r \cos \theta, y = r \sin \theta.$$

在 D_2 中, $-r^2 \cos 2\theta + 2 \leq 0$, 所以

$$0 \leq \theta \leq \frac{\pi}{6}, \quad \sqrt{\frac{2}{\cos 2\theta}} \leq r \leq 2.$$

$$\begin{aligned} \therefore \sigma(D_2) &= \iint_{D_2} dx dy = \int_0^{\frac{\pi}{6}} d\theta \int_{\sqrt{\frac{2}{\cos 2\theta}}}^2 r dr \\ &= \frac{1}{2} \int_0^{\frac{\pi}{6}} d\theta \left(4 - \frac{2}{\cos 2\theta} \right) = \frac{\pi}{3} - \frac{1}{2} \int_0^{\frac{\pi}{3}} \frac{d\varphi}{\cos \varphi} \\ &= \frac{\pi}{3} - \frac{1}{2} \int_0^{\frac{\pi}{3}} \frac{d \sin \varphi}{1 - \sin^2 \varphi} = \frac{\pi}{3} - \frac{1}{4} \ln \left(\frac{1 + \sin \theta}{1 - \sin \theta} \right) \Big|_0^{\frac{\pi}{3}} \\ &= \frac{\pi}{3} - \frac{1}{4} \ln \left(\frac{2 + \sqrt{3}}{2 - \sqrt{3}} \right) \end{aligned}$$

最后有

$$I = 4(\sigma(D) - 2\sigma(D_2)) = \frac{4\pi}{3} + 2\ln\left(\frac{2+\sqrt{3}}{2-\sqrt{3}}\right) = \frac{4\pi}{3} + 4\ln(2+\sqrt{3}).$$

2. 计算三重积分

$$I = \iiint_{[0,1]^3} \frac{du \, dv \, dw}{(1+u^2+v^2+w^2)^2}.$$

解: $u = r \cos \theta, v = r \sin \theta, w = \tan \varphi$ 则其 Jacob 行列式为

$$\begin{vmatrix} \cos \theta & -r \sin \theta & 0 \\ \sin \theta & r \cos \theta & 0 \\ 0 & 0 & \sec^2 \varphi \end{vmatrix} = r \sec^2 \varphi$$

$$\begin{aligned} I &= 2 \int_0^{\frac{\pi}{4}} d\theta \int_0^{\frac{\pi}{4}} d\varphi \int_0^{\sec \theta} \frac{r \sec^2 \varphi}{(1+r^2+\tan^2 \varphi)^2} dr \\ &= \int_0^{\frac{\pi}{4}} d\theta \int_0^{\frac{\pi}{4}} \left(\frac{\sec^2 \varphi}{r^2 + \sec^2 \varphi} \right) \Big|_{r=\sec \theta}^{r=0} d\varphi \\ &= \left(\frac{\pi}{4} \right)^2 - \int_0^{\frac{\pi}{4}} \int_0^{\frac{\pi}{4}} \frac{\sec^2 \varphi}{\sec^2 \varphi + \sec^2 \theta} d\theta d\varphi \\ &= \left(\frac{\pi}{4} \right)^2 - \frac{1}{2} \cdot \left(\frac{\pi}{4} \right)^2 = \frac{\pi^2}{32} \end{aligned}$$

其中

$$\begin{aligned} A &= \int_0^{\frac{\pi}{4}} \int_0^{\frac{\pi}{4}} \frac{\sec^2 \varphi}{\sec^2 \varphi + \sec^2 \theta} d\theta d\varphi = \int_0^{\frac{\pi}{4}} \int_0^{\frac{\pi}{4}} \frac{\sec^2 \theta}{\sec^2 \theta + \sec^2 \varphi} d\varphi d\theta \\ 2A &= \int_0^{\frac{\pi}{4}} \int_0^{\frac{\pi}{4}} \frac{\sec^2 \varphi + \sec^2 \theta}{\sec^2 \varphi + \sec^2 \theta} d\theta d\varphi = \left(\frac{\pi}{4} \right)^2 \\ I &= \left(\frac{\pi}{4} \right)^2 - A = \left(\frac{\pi}{4} \right)^2 - \frac{1}{2} \left(\frac{\pi}{4} \right)^2 = \frac{\pi^2}{32} \end{aligned}$$

3. 设 $a > 0, b > 0$. 试求下面的积分:

$$(1) I_1 = \int_0^1 \sin\left(\ln \frac{1}{x}\right) \cdot \frac{x^b - x^a}{\ln x} dx \quad (2) I_2 = \int_0^1 \cos\left(\ln \frac{1}{x}\right) \cdot \frac{x^b - x^a}{\ln x} dx.$$

解:

$$\therefore \frac{x^b - x^a}{\ln x} = \frac{x^u}{\ln x} \Big|_a^b = \int_a^b x^u du,$$

$$\begin{aligned} I_1 &= \int_0^1 \left(\sin \left(\ln \frac{1}{x} \right) \int_a^b x^u du \right) dx \\ &= \int_0^1 \int_a^b x^u \sin \left(\ln \frac{1}{x} \right) dx du \\ &= \int_a^b \int_0^1 x^u \sin \left(\ln \frac{1}{x} \right) dx du \quad (\text{交换顺序}) \\ &= \int_a^b \int_{+\infty}^0 e^{-vu} \sin v (-e^{-v}) dv du \\ &\quad \left(\ln \frac{1}{x} = v, x = e^{-v}, dx = -e^{-v} dv \right) \\ &= \int_a^b \int_0^{+\infty} e^{-(u+1)v} \sin v dv du \\ &= \int_a^b \left(\frac{1}{1 + (u+1)^2} \right) du = \arctan(b+1) - \arctan(a+1) \\ &= \arctan \left(\frac{b-a}{1 + (a+1)(b+1)} \right) \end{aligned}$$

$$\begin{aligned} I_2 &= \int_0^1 \int_a^b x^u \cos \left(\ln \frac{1}{x} \right) dx du \\ &= \int_a^b \int_0^1 x^u \cos \left(\ln \frac{1}{x} \right) dx du \\ &= \int_a^b \int_{+\infty}^0 e^{-ne} \cos v (-e^{-v}) dv du \\ &= \int_a^b \int_0^{+\infty} e^{-(u+1)v} \cos v dv du \\ &= \int_a^b \frac{u+1}{1 + (u+1)^2} du \\ &= \frac{1}{2} \int_{(a+1)^2}^{(b+1)^2} \frac{d(u+1)^2}{1 + (u+1)^2} \\ &= \frac{1}{2} \ln \frac{1 + (b+1)^2}{1 + (a+1)^2} \end{aligned}$$

$$4. \text{ 设 } D = \{(x, y) \mid x^2 + y^2 \leq 1\}. \text{ 求 } I = \iint_D \left| \frac{x+y}{\sqrt{2}} - x^2 - y^2 \right| dx dy.$$

解 作变换

$$\begin{aligned} u &= \frac{x+y}{\sqrt{2}}, v = \frac{x-y}{\sqrt{2}}, \frac{\partial(x, y)}{\partial(u, v)} = 1. \\ \therefore I &= \iint_{u^2+v^2 \leq 1} |u - u^2 - v^2| du dv \end{aligned}$$

由于

$$u - u^2 - v^2 = \frac{1}{4} - \left(u - \frac{1}{2} \right)^2 - v^2$$

因此将 D 分解为两个区域的并: $D = D_1 \cup D_2$, 其中

$$\begin{aligned} D_1 &= \left\{ (u, v) \mid \left(u - \frac{1}{2} \right)^2 + v^2 \leq \frac{1}{4} \right\} \\ D_2 &= \left\{ (u, v) \mid \left(u - \frac{1}{2} \right)^2 + v^2 \geq \frac{1}{4}, u^2 + v^2 \leq 1 \right\} \end{aligned}$$

所以, 在 D_1 和 D_2 上

$$|u - u^2 - v^2| = \begin{cases} u - u^2 - v^2 & (u, v) \in D_1 \\ u^2 + v^2 - u & (u, v) \in D_2 \end{cases}$$

因此

$$\begin{aligned} I &= \iint_{D_1} (u - u^2 - v^2) \, du \, dv + \iint_{D_2} (u^2 + v^2 - u) \, du \, dv \\ &= \iint_D (u^2 + v^2 - u) \, du \, dv + 2 \iint_{D_1} (u - u^2 - v^2) \, du \, dv = a + 2b \end{aligned}$$

其中 a 和 b 分别是两个积分. 用极坐标变换

$$u = r \cos \theta, v = r \sin \theta, 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi$$

得 a 的积分为

$$a = \iint_D (u^2 + v^2 - u) \, du \, dv = \int_0^{2\pi} d\theta \int_0^1 (r^2 - r \cos \theta) r \, dr = \frac{\pi}{2}.$$

在对 b 积分时, 用坐标变换

$$\begin{aligned} u &= \frac{1}{2} + r \cos \theta, v = r \sin \theta \quad 0 \leq r \leq \frac{1}{2}, 0 \leq \theta \leq 2\pi, \\ \therefore b &= \iint_{D_1} (u - u^2 - v^2) \, du \, dv = \iint_{D_1} \left(\frac{1}{4} - \left(u - \frac{1}{2} \right)^2 - v^2 \right) \, du \, dv \\ &= \int_0^{2\pi} d\theta \int_0^{\frac{1}{2}} \left(\frac{1}{4} - r^2 \right) r \, dr = \frac{\pi}{32}. \end{aligned}$$

所以

$$I = a + 2b = \frac{9\pi}{16}.$$

5. 试求圆盘 $(x-a)^2 + (y-a)^2 \leq a^2$ 与曲线 $(x^2 + y^2)^2 = 8a^2xy$ 所围部分相交的区域 D 的面积.

解: 采用极坐标. 圆盘的径向区间为

$$a(\sin \theta + \cos \theta - \sqrt{\sin 2\theta}) \leq r \leq a(\sin \theta + \cos \theta + \sqrt{\sin 2\theta}),$$

而双纽线内部满足 $0 \leq r \leq 2a\sqrt{\sin 2\theta}$. 二者相交的临界角为 $\alpha = \frac{1}{2} \arcsin(1/8)$, 区域关于 $\theta = \pi/4$ 对称, 故

$$\begin{aligned} S &= a^2 \int_{\alpha}^{\pi/4} \left[2 \sin 2\theta + 2(\sin \theta + \cos \theta) \sqrt{\sin 2\theta} - 1 \right] d\theta \\ &= a^2 \left(\frac{\sqrt{7}}{2} + \arcsin \frac{\sqrt{14}}{8} \right). \end{aligned}$$

6. 计算曲面 $(x^2 + y^2)^2 + z^4 = y$ 所围的体积 V .

6. 解: $\because y = (x^2 + y^2)^2 + z^4 \geq 0$, 由对称性 $V(\Omega) = 4V(\Omega_0)$ $\Omega_0: x \geq 0, y \geq 0, \Omega: y \geq 0$

$$\text{let } \begin{cases} x = r \sin \theta \cos \varphi \\ y = r \sin \theta \sin \varphi \\ z = r \cos \theta \end{cases} \Rightarrow \begin{cases} r^4 (\sin^4 \theta + \cos^4 \theta) \leq r \sin \theta \sin \varphi \\ 0 \leq r \leq \left(\frac{\sin \theta \sin \varphi}{\sin^4 \theta + \cos^4 \theta} \right)^{\frac{1}{3}} = r_1, \\ 0 \leq \theta \leq \frac{\pi}{2} \quad 0 \leq \varphi \leq \frac{\pi}{2} \end{cases}$$

$$\begin{aligned} \therefore V(\Omega) &= 4 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \sin \theta \int_0^{r_1} r^2 dr d\theta d\varphi \\ &= \frac{4}{3} \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \frac{\sin^2 \theta \sin \varphi}{\sin^4 \theta + \cos^4 \theta} d\theta d\varphi \\ &= \frac{4}{3} \int_0^{\frac{\pi}{2}} \sin \varphi d\varphi \int_0^{\frac{\pi}{2}} \frac{\sin^2 \theta}{\sin^4 \theta + \cos^4 \theta} d\theta = \frac{4}{3} \int_0^{\frac{\pi}{2}} \frac{\tan^2 \theta d \tan \theta}{1 + \tan^4 \theta} \\ &= \frac{4}{3} \int_0^{+\infty} \frac{s^2}{1 + s^4} ds \\ I &= \int_0^{+\infty} \frac{s^2}{1 + s^4} ds = \int_{+\infty}^0 \frac{\frac{1}{t^2} \cdot \left(-\frac{1}{t^2}\right) dt}{1 + \frac{1}{t^4}} = \int_0^{+\infty} \frac{ds}{1 + s^4} \\ 2I &= \int_0^{+\infty} \frac{s^2 + 1}{1 + s^4} ds = \int_0^{+\infty} \frac{1 + \frac{1}{s^2}}{\frac{1}{s^2} + s^2} ds = \int_0^{+\infty} \frac{d\left(s - \frac{1}{s}\right)}{\left(s - \frac{1}{s}\right)^2 + (\sqrt{2})^2} \\ &= \frac{1}{\sqrt{2}} \arctan \frac{s - \frac{1}{s}}{\sqrt{2}} \Big|_0^{+\infty} = \frac{\pi}{\sqrt{2}}, I = \frac{\sqrt{2}\pi}{4}, V(\Omega) = \frac{\sqrt{2}\pi}{3} \end{aligned}$$

7. 证明: $\iint_{[0,1]^2} (xy)^{xy} dx dy = \int_0^1 t^t dt$.

证明: Let $u = xy, v = x$. Then $0 \leq u \leq v \leq 1$ and $dx dy = du dv/v$.

$$\begin{aligned} I &= \int_0^1 \frac{dv}{v} \int_0^v u^u du = - \int_0^1 (\ln v) v^v dv \\ &= - \int_0^1 (\ln v + 1) v^v dv + \int_0^1 v^v dv = \int_0^1 t^t dt. \end{aligned}$$

(* 式处运用了分部积分、构造原函数)

8. 设 a, b 是不全为 0 的常数. 求证:

$$\iint_{x^2+y^2 < 1} f(ax+by+c) dx dy = 2 \int_{-1}^1 \sqrt{1-t^2} f\left(t\sqrt{a^2+b^2}+c\right) dt$$

证明: 令 $ax+by = \sqrt{a^2+b^2}u = \frac{(a^2+b^2)u}{\sqrt{a^2+b^2}}$, 为了便于解出对称的 x 和 y 并便于计算 J , 不妨再令 $ax-by = \frac{(a^2-b^2)u-2abv}{\sqrt{a^2+b^2}}$, 则 $x = \frac{au-bv}{\sqrt{a^2+b^2}}, y = \frac{bu+av}{\sqrt{a^2+b^2}}$

$$J = \begin{vmatrix} \frac{a}{\sqrt{a^2+b^2}} & \frac{-b}{\sqrt{a^2+b^2}} \\ \frac{b}{\sqrt{a^2+b^2}} & \frac{a}{\sqrt{a^2+b^2}} \end{vmatrix} = \frac{a^2+b^2}{a^2+b^2} = 1.$$

由 $D: x^2 + y^2 \leq 1$, 有

$$\left(\frac{au-bv}{\sqrt{a^2+b^2}}\right)^2 + \left(\frac{bu+av}{\sqrt{a^2+b^2}}\right)^2 = \frac{(a^2+b^2)u^2 + (a^2+b^2)v^2}{a^2+b^2} = u^2 + v^2 \leq 1$$

所以 D' 也为单位圆域, 故

$$\begin{aligned}\iint_D f(ax+by+c)dx dy &= \iint_D f(u\sqrt{a^2+b^2}+c)|J|du dv \\ &= \int_{-1}^1 f(u\sqrt{a^2+b^2}+c)du \int_{-\sqrt{1-u^2}}^{\sqrt{1-u^2}} 1 dv \\ &= 2 \int_{-1}^1 \sqrt{1-u^2} f(u\sqrt{a^2+b^2}+c) du\end{aligned}$$

□

9. 设 f 是连续可导的单变量函数. 令 $F(t) = \iint_{[0,t]^2} f(xy)dx dy$. 求证:

$$(1) F'(t) = \frac{2}{t} \left(F(t) + \iint_{[0,t]^2} xy f'(xy) dx dy \right) \quad (2) F'(t) = \frac{2}{t} \int_0^{t^2} f(s) ds.$$

解: (1) 令 $u = x/t, v = y/t$ 从而改变对于变量 t 的积分域:

$$F(t) = \iint_{[0,1]^2} t^2 f(t^2 uv) du dv$$

由

$$\frac{\partial}{\partial t} (t^2 f(t^2 uv)) = 2t^3 uv f'(t^2 uv) + 2t f(t^2 uv)$$

New-Leibniz's rule:

$$F'(t) = \iint_{[0,1]^2} 2t^3 uv f'(t^2 uv) du dv + \iint_{[0,1]^2} 2t f(t^2 uv) du dv$$

写回原来的变量 $x = tu, y = tv$:

$$F'(t) = \frac{2}{t} \left[F(t) + \iint_{[0,t]^2} xy f'(xy) dx dy \right]$$

(2) 令 $\alpha(t) = \int_0^t f(\tau) d\tau$. 替换 $p = xy$ 得到:

$$\int_0^t f(xy) dx = \frac{1}{y} \int_0^{ty} f(p) dp = \frac{\alpha(ty)}{y}$$

故

$$F(t) = \int_0^t \frac{\alpha(ty)}{y} dy$$

令 $m = ty$,

$$F(t) = \int_0^{t^2} \frac{\alpha(m)}{m} dm$$

$$\therefore F'(t) = \frac{\alpha(t^2)}{t^2} \cdot 2t = \frac{2}{t} \alpha(t^2) = \frac{2}{t} \int_0^{t^2} f(s) ds$$

另法:

证明 先证明 (2): 用累次积分

$$\begin{aligned} F(t) &= \int_0^t dx \int_0^t f(xy) dy = \int_0^t \frac{1}{x} dx \int_0^{tx} f(s) ds \\ &= \int_0^t \frac{g(tx)}{x} dx = \int_0^{t^2} \frac{g(u)}{u} du \end{aligned}$$

其中 $g(u) = \int_0^u f(s) ds$. 于是

$$F'(t) = 2t \cdot \frac{g(t^2)}{t^2} = \frac{2}{t} \int_0^{t^2} f(s) ds$$

再证明 (1):

$$\begin{aligned} \frac{2}{t} \iint_{[0,t]^2} xy f'(xy) dx dy &= \frac{2}{t} \int_0^t dx \int_0^t xy f'(xy) dy \\ &= \frac{2}{t} \int_0^t \frac{1}{x} dx \int_0^{tx} u f'(u) du = \frac{2}{t} \int_0^t \frac{1}{x} (tx f(tx) - g(tx)) dx \\ &= \frac{2}{t} \int_0^{t^2} \frac{1}{s} (s f(s) - g(s)) ds = F'(t) - \frac{2}{t} F(t). \end{aligned}$$

所以 (1) 成立. □

10. (Poincaré 不等式) 设 $\varphi(x), \psi(x)$ 是 $[a, b]$ 上的连续函数, $f(x, y)$ 在区域 $D = \{(x, y) : a \leq x \leq b, \varphi(x) \leq y \leq \psi(x)\}$ 上连续可微, 且有 $f(x, \varphi(x)) = 0$, 则存在 $M > 0$, 使得

$$\iint_D f^2(x, y) dx dy \leq M \iint_D (f'_y(x, y))^2 dx dy$$

证明 由 Newton-Leibniz 公式和 Cauchy-Schwarz 不等式,

$$f^2(x, y) = [f(x, y) - f(x, \varphi(x))]^2 = \left(\int_{\varphi(x)}^y \frac{\partial f}{\partial t}(x, t) dt \right)^2 \leq (y - \varphi(x)) \int_{\varphi(x)}^y \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt$$

$$\begin{aligned} \therefore \iint_D f^2(x, y) dx dy &= \int_a^b dx \int_{\varphi(x)}^{\psi(x)} f^2(x, y) dy \\ &\leq \int_a^b dx \int_{\varphi(x)}^{\psi(x)} (y - \varphi(x)) dy \int_{\varphi(x)}^y \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt \\ &= \int_a^b dx \int_{\varphi(x)}^{\psi(x)} \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt \int_t^{\psi(x)} (y - \varphi(x)) dy \\ &\leq \int_a^b dx \int_{\varphi(x)}^{\psi(x)} \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt \int_{\varphi(x)}^{\psi(x)} (y - \varphi(x)) dy \\ &= \int_a^b dx \int_{\varphi(x)}^{\psi(x)} \frac{1}{2} (\psi(x) - \varphi(x))^2 \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt \\ &\leq M \int_a^b dx \int_{\varphi(x)}^{\psi(x)} \left(\frac{\partial f}{\partial t}(x, t) \right)^2 dt = M \iint_D \left(\frac{\partial f}{\partial y}(x, y) \right)^2 dx dy, \end{aligned}$$

这里 M 是满足

$$M > \max_{a \leq x \leq b} \frac{1}{2} (\psi(x) - \varphi(x))^2 \quad \text{的常数}$$

□

11. 设 $a > 0, \Omega_n(a) : x_1 + \cdots + x_n \leq a, x_i \geq 0 (i = 1, 2, \cdots, n)$. 求积分

$$I_n(a) = \int \cdots \int_{\Omega_n(a)} x_1 x_2 \cdots x_n \, dx_1 \, dx_2 \cdots dx_n$$

解: 引入狄利克雷多重积分公式:

$$\int \cdots \int_{\substack{x_1, \dots, x_n \geq 0 \\ x_1 + \dots + x_n \leq 1}} x_1^{p_1-1} \cdots x_n^{p_n-1} dx_1 \cdots dx_n = \frac{\Gamma(p_1) \cdots \Gamma(p_n)}{\Gamma(p_1 + \cdots + p_n + 1)} (p_1, \dots, p_n > 0)$$

由于当 $n = 2$ 时公式已经成立, 我们将应用数学归纳法. 设它对 $n - 1$ 重积分正确. 将公式左端重写为形如

$$\int_0^1 x_n^{p_n-1} dx_n \int \cdots \int_{\substack{x_1, \dots, x_{n-1} \geq 0 \\ x_1 + \dots + x_{n-1} \leq 1 - x_n}} x_1^{p_1-1} \cdots x_{n-1}^{p_{n-1}-1} dx_1 \cdots dx_{n-1}$$

后, 在里面的积分中进行变换

$$x_1 = (1 - x_n) \xi_1, \cdots, x_{n-1} = (1 - x_n) \xi_{n-1},$$

再应用狄利克雷公式到 $n - 1$ 重积分. 我们将得

$$\frac{\Gamma(p_1) \cdots \Gamma(p_{n-1})}{\Gamma(p_1 + \cdots + p_{n-1} + 1)} \int_0^1 x_n^{p_n-1} (1 - x_n)^{p_1 + \cdots + p_{n-1}} dx_n$$

如将积分用它的 Γ 表示式:

$$\frac{\Gamma(p_n) \Gamma(p_1 + \cdots + p_{n-1} + 1)}{\Gamma(p_1 + \cdots + p_{n-1} + p_n + 1)}$$

来代替, 便得所需结果. 此题中当 $p_1 = \cdots = p_n = 2$ 时, 换元 $t_i = \frac{x_i}{a}$

$$I_n(a) = a^{2n} \frac{(\Gamma(2))^n}{\Gamma(2n + 1)} = \frac{a^{2n}}{(2n)!}.$$

另法: 作变换 $x_i = at_i, i = 1, 2, \cdots, n$, 则 $I_n(a) = a^{2n} \int_{\Omega_n(1)} \int t_1 t_2 \cdots t_n \, dt_1 \, dt_2 \cdots dt_n = a^{2n} I_n(1)$

用累次积分, 可得

$$\begin{aligned} I_n(1) &= \int \cdots \int_{\Omega_n(1)} t_1 t_2 \cdots t_n \, dt_1 \, dt_2 \cdots dt_n \\ &= \int_0^1 t_n \, dt_n \int_{t_1 + \cdots + t_{n-1} \leq 1 - t_n} t_1 \cdots t_{n-1} \, dt_1 \cdots dt_{n-1} \\ &= \int_0^1 t_n I_{n-1}(1 - t_n) \, dt_n = \int_0^1 t_n (1 - t_n)^{2(n-1)} I_{n-1}(1) \, dt_n. \\ I_n(1) &= \frac{1}{2n(2n-1)} I_{n-1}(1) \end{aligned}$$

注意到 $I_1(1) = \int_0^1 t \, dt = \frac{1}{2}$. 由上面的递推公式, 可得 $I_n(1) = \frac{1}{(2n)!}$. 故, $I_n(a) = \frac{a^{2n}}{(2n)!}$

12. 设 $f(x_1, x_2, \dots, x_n)$ 为 n 元连续函数, 证明:

$$\int_a^b dx_1 \int_a^{x_1} dx_2 \cdots \int_a^{x_{n-1}} f(x_1, x_2, \dots, x_n) dx_n = \int_a^b dx_n \int_{x_n}^b dx_{n-1} \cdots \int_{x_2}^b f(x_1, x_2, \dots, x_n) dx_1$$

证明: 两边都是同一区域 $a \leq x_n \leq x_{n-1} \leq \cdots \leq x_1 \leq b$ 上的积分, 只是积分次序相反; 由 Fubini 定理, 两者相等。

□

11 曲线积分和曲面积分

11.1 习题 数量场在曲线上的积分

1. 计算下列曲线的弧长.

(1) $\mathbf{r}(t) = e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + e^t \mathbf{k} (0 \leq t \leq 2\pi)$

(2) $x = 3t, y = 3t^2, z = 2t^3$ 从 $O(0, 0, 0)$ 到 $A(3, 3, 2)$ 那一段;

(3) $x = a \cos t, y = a \sin t, z = a \ln \cos t (0 \leq t \leq \frac{\pi}{4})$;

(4) $z^2 = 2ax$ 与 $9y^2 = 16xz$ 的交线, 由点 $O(0, 0, 0)$ 到点 $A(2a, \frac{8a}{3}, 2a)$;

(5) $4ax = (y+z)^2$ 与 $4x^2 + 3y^2 = 3z^2$ 的交线, 由原点到点 $M(x, y, z) (a > 0, z \geq 0)$.

解:

$$(1) s = \int_0^{2\pi} \sqrt{3} e^t dt = \sqrt{3} (e^{2\pi} - 1),$$

$$(2) s = \int_0^1 \sqrt{3^2 + (6t)^2 + (6t^2)^2} dt = \int_0^1 (6t^2 + 3) dt = 5$$

$$(3) s = \int_0^{\frac{\pi}{4}} a \sec t dt = a \ln(\sqrt{2} + 1),$$

$$(4) s = \int_0^{2a} \sqrt{1 + \left(\frac{t}{a}\right)^2 + \frac{2t}{a}} dt = \int_0^{2a} \left(1 + \frac{t}{a}\right) dt = 4a, a > 0$$

$$(5) \text{ 令 } T = y + z, \quad x = \frac{T^2}{4a}, \quad y = \frac{T}{2} - \frac{T^3}{24a^2}, \quad z = \frac{T}{2} + \frac{T^3}{24a^2},$$

$$s = \int_0^{T_M} \frac{1}{\sqrt{2}} \left(1 + \frac{T^2}{4a^2}\right) dT = \frac{T_M}{\sqrt{2}} + \frac{T_M^3}{12\sqrt{2}a^2}, \quad T_M = y_M + z_M.$$

2. 计算下列曲线积分.

(1) $\int_L y^2 ds, \quad L: x = a(t - \sin t), y = a(1 - \cos t), (0 \leq t \leq 2\pi)$

(2) $\int_L \frac{z^2}{x^2 + y^2} ds, \quad L: x = a \cos t, y = a \sin t, z = at, (0 \leq t \leq 2\pi)$;

(3) $\int_L (x+y) ds, \quad L: \text{顶点为 } O(0, 0), A(1, 0), B(0, 1) \text{ 的三角形周界};$

(4) $\int_L \frac{dS}{x-y}, \quad L: \text{联结点 } A(0, -2) \text{ 到点 } B(4, 0) \text{ 的直线段};$

(5) $\int_L (x+y+z) ds, \quad L: \text{直线段 } AB: A(1, 1, 0), B(1, 0, 0) \text{ 及螺线 } BC: x = \cos t, y = \sin t, z = t (0 \leq t \leq 2\pi) \text{ 组成};$

(6) $\int_L e^{\sqrt{x^2+y^2}} ds, \quad L: \text{由曲线 } r = a, \varphi = 0, \varphi = \frac{\pi}{4} \text{ 所围成的区域边界};$

(7) $\int_L x ds, \quad L: \text{对数螺线 } r = ae^{k\varphi} (k > 0) \text{ 在圆 } r = a \text{ 内的那一段};$

(8) $\int_L z ds, L \text{ 是圆锥螺线 } x = t \cos t, y = t \sin t, z = t (0 \leq t \leq t_0)$;

(9) $\int_L x \sqrt{x^2 - y^2} ds, \quad L: \text{双纽线 } (x^2 + y^2)^2 = a^2 (x^2 - y^2) (x \geq 0) \text{ 的一半};$

(10) $\int_L (x^2 + y^2 + z^2)^n ds, \quad L: \text{圆周 } x^2 + y^2 = a^2, z = 0;$

(11) $\int_L x^2 ds, \quad L: \text{圆周 } x^2 + y^2 + z^2 = a^2, x + y + z = 0;$

(12) $\int_L (xy + yz + zx) ds, \quad L: \text{圆周 } x^2 + y^2 + z^2 = a^2, x + y + z = 0.$

解:

$$(1) I = \sqrt{2}a^3 \int_0^{2\pi} (1 - \cos t)^{\frac{5}{2}} dt = \frac{256a^3}{15}$$

$$(2) I = \int_0^{2\pi} \frac{a^2 t^2}{a^2} \sqrt{a^2 + a^2} dt = \sqrt{2} \int_0^{2\pi} at^2 dt = \frac{8\sqrt{2}a\pi^3}{3}, (a > 0)$$

$$(3) I = \int_L = \int_{OA} + \int_{AB} + \int_{BO} = \int_0^1 t dt + \int_0^1 \sqrt{2} dt + \int_0^1 (1-t) dt = \sqrt{2} + 1$$

$$(4) I = \int_0^4 \frac{\sqrt{1+\frac{1}{4}}}{\frac{1}{2}t+2} dt = \sqrt{5} \int_0^4 \frac{dt}{t+4} = \sqrt{5} \ln 2$$

$$(5) I = \int_4^1 + \int_{L_2} = \int_0^1 (2-t) dt + \int_0^{2\pi} (t + \sin t + \cos t) \sqrt{2} dt = \frac{3}{2} + 2\sqrt{2}\pi^2$$

$$(6) I = \int_0^a e^r dr + \int_0^a e^r dr + \int_0^{\frac{\pi}{4}} e^a a d\varphi = 2(e^a - 1) + \frac{\pi}{4} a e^a$$

$$(7) I = \int_{-\infty}^0 a e^{k\varphi} \cos \varphi \sqrt{r^2 + r'^2} d\varphi = a^2 \sqrt{1+k^2} \int_{-\infty}^0 e^{2k\varphi} \cos \varphi d\varphi = \frac{2a^2 k \sqrt{1+k^2}}{4k^2+1}$$

$$(8) I = \int_0^{t_0} t \sqrt{(\cos t - t \sin t)^2 + (\sin t + t \cos t)^2 + 1} dt = \int_0^{t_0} t \sqrt{2+t^2} dt = \frac{(t_0^2+2)^{\frac{3}{2}} - 2^{\frac{3}{2}}}{3}$$

$$(9) I = a^3 \int_{-\pi/4}^{\pi/4} \cos \theta \cos 2\theta d\theta = \frac{2\sqrt{2}}{3} a^3$$

$$(10) I = \int_0^{2\pi} a^{2n+1} d\theta = 2\pi a^{2n+1}, a > 0$$

$$(11) I = \oint x^2 ds = \oint y^2 ds = \oint z^2 ds = \frac{1}{3} \oint a^2 ds = \frac{2\pi a^3}{3}$$

$$(12) I = \frac{1}{2} \int_L (x+y+z)^2 - (x^2 + y^2 + z^2) ds = - \int_L \frac{a^2}{2} ds = -\pi a^3, a > 0$$

3. 求曲线 $x = e^t \cos t, y = e^t \sin t, z = e^t$ 从 $t = 0$ 到任意点间那段弧的质量, 设它各点的密度与该点到原点的距离平方成反比, 且在点 $(1, 0, 1)$ 处的密度为 1.

解:

$$r^2 = 2e^{2t}, \quad \rho = \frac{2}{r^2} = e^{-2t}, \quad ds = \sqrt{3}e^t dt,$$

$$m = \sqrt{3} \int_0^{t_0} e^{-t} dt = \sqrt{3} (1 - e^{-t_0}).$$

4. 求螺旋线一圈 $x = a \cos t, y = a \sin t, z = \frac{h}{2\pi}t (0 \leq t \leq 2\pi)$ 对于各坐标轴的转动惯量 (设密度 $\rho = 1$).

解:

$$J_z = \int_L (x^2 + y^2) g(x, y, z) ds = \int_0^{2\pi} a^2 \sqrt{a^2 + \frac{h^2}{4\pi^2}} dt = 2\pi a^2 \sqrt{a^2 + \frac{h^2}{4\pi^2}}$$

$$J_x = \int_L (y^2 + z^2) \rho(x, y, z) ds = \int_0^{2\pi} \left(a^2 \sin^2 t + \frac{h^2}{4\pi^2} t^2 \right) \sqrt{a^2 + \frac{h^2}{4\pi^2}} dt = \left(\pi a^2 + \frac{2\pi h^2}{3} \right) \sqrt{a^2 + \frac{h^2}{4\pi^2}}$$

$$J_y = \int_L (x^2 + z^2) P(x, y, z) ds = \int_0^{2\pi} \left(a^2 \cos^2 t + \frac{h^2}{4\pi^2} t^2 \right) \sqrt{a^2 + \frac{h^2}{4\pi^2}} dt = \left(\pi a^2 + \frac{2\pi h^2}{3} \right) \sqrt{a^2 + \frac{h^2}{4\pi^2}}$$

5. 求半径为 a 的均匀半圆弧 (密度为 ρ) 对于处在圆心 O 质量为 M 的质点的引力.

解:

$$5. \quad dF = \frac{GM\rho a d\theta}{a^2}$$

$$\vec{F} = \begin{cases} F_x = 0, \\ F_y = \int_0^\pi \frac{GM\rho}{a} \sin \theta d\theta = \frac{2GM\rho}{a} \end{cases}$$

11.2 习题 数量场在曲面上的积分

1. 求下列曲面在指定部分的面积. (1) 锥面 $z = \sqrt{x^2 + y^2}$ 包含在圆柱 $x^2 + y^2 = 2x$ 内的部分 (2) 柱面 $x^2 + y^2 = a^2$ 被平面 $x + z = 0, x - z = 0 (x > 0, y > 0)$ 所截的那部分; (3) 圆柱面 $x^2 + y^2 = a^2$ 被圆柱 $y^2 + z^2 = a^2$ 所割下的那部分; (4) 球面 $x^2 + y^2 + z^2 = 3a^2$ 和抛物面 $x^2 + y^2 = 2az (z \geq 0)$ 所围成的立体的全表面; (5) 曲面 $x = \frac{1}{2}(2y^2 + z^2)$ 被柱面 $4y^2 + z^2 = 1$ 所截下的那部分; (6) 锥面 $z^2 = x^2 + y^2$ 被 Oxy 平面和 $z = \sqrt{2}(\frac{x}{2} + 1)$ 所截下的那部分; (7) 螺旋面 $x = r \cos \varphi, y = r \sin \varphi, z = h\varphi$ 在 $0 < r < a, 0 < \varphi < 2\pi$ 那部分; (8) 曲面 $(x^2 + y^2 + z^2)^2 = 2a^2xy$ 的全部.

解:

$$\begin{aligned}\sigma_1(s) &= \iint_{D_{xy}} \sqrt{1 + z_x'^2 + z_y'^2} dx dy = \sqrt{2} \iint_{D_{xy}} dx dy = \sqrt{2}\pi \\ \sigma_2(s) &= \iint_D \sqrt{1 + y_x'^2 + y_z'^2} = \iint_D \frac{a}{\sqrt{a^2 - x^2}} dz dx = \int_0^a dx \int_{-x}^x \frac{adz}{\sqrt{a^2 - x^2}} = 2a^2 \\ \sigma_3(s) &= \iint_D \sqrt{EG - F^2} dS = \iint_{D_{\theta\varphi}} a^2 \sin \varphi d\theta d\varphi = 8a^2 \\ \sigma_4(s) &= \iint_D dS = \iint_{x^2 + y^2 \leq 2a^2} \left(\sqrt{1 + \frac{x^2 + y^2}{a^2}} + \frac{\sqrt{3}a}{\sqrt{3a^2 - (x^2 + y^2)}} \right) = \frac{16}{3}\pi a^2 \\ \sigma_5(s) &= \iint_{D_{yz}} \sqrt{1 + 4y^2 + z^2} dy dz = \int_0^{2\pi} \int_0^1 \frac{\sqrt{1 + r^2}}{2} r dr d\theta = \frac{(2\sqrt{2} - 1)\pi}{3} \\ \sigma_6(s) &= \sqrt{2} \int_0^{2\pi} \int_0^{\sqrt{2 - \cos \theta}} r dr d\theta = 8\pi \\ \sigma_7(s) &= \iint_{D_{r\varphi}} \sqrt{EG - F^2} dr d\varphi = \iint_{D_{r\varphi}} \sqrt{1 \cdot (r^2 + h^2) - 0^2} dr d\varphi \\ &= \int_0^a \int_0^{2\pi} \sqrt{r^2 + h^2} dr d\varphi = 2\pi \int_0^a \sqrt{r^2 + h^2} dr \\ &= \pi \left[a\sqrt{a^2 + h^2} + h^2 \ln \frac{a + \sqrt{a^2 + h^2}}{|h|} \right] \\ \sigma_8(s) &= 4 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} a^2 \sin^2 \theta d\varphi d\theta = \frac{\pi^2 a^2}{2}\end{aligned}$$

Note: 关于第 8 题, 曲面的球面坐标表示为 $r^2 = a^2 \sin^2 \theta \sqrt{\sin 2\varphi}$, 仅考虑第一卦限, 曲面可用光

$$\begin{aligned}\text{滑参数曲面: } \begin{cases} x = a \sin^2 \theta \sqrt{\sin 2\varphi} \cos \varphi \\ y = a \sin^2 \theta \sqrt{\sin 2\varphi} \sin \varphi \\ z = a \sin \theta \sqrt{\sin 2\varphi} \cos \theta \end{cases} \text{表示} &\Rightarrow \begin{cases} x'_\theta = a \sin 2\theta \sqrt{\sin 2\varphi} \cos \varphi \\ y'_\theta = a \sin 2\theta \sqrt{\sin 2\varphi} \sin \varphi \\ z'_\theta = a \cos 2\theta \sqrt{\sin 2\varphi} \end{cases} \\ \begin{cases} x'_\varphi = a \sin^2 \theta \left(\frac{\cos 2\varphi \cos \varphi}{\sqrt{\sin 2\varphi}} - \sqrt{\sin 2\varphi} \sin \varphi \right) \\ y'_\varphi = a \sin^2 \theta \left(\frac{\cos 2\varphi \sin \varphi}{\sqrt{\sin 2\varphi}} + \sqrt{\sin 2\varphi} \cos \varphi \right) \\ z'_\varphi = a \sin \theta \cos \theta \frac{\cos 2\varphi}{\sqrt{\sin 2\varphi}} \end{cases} &\Rightarrow \begin{cases} E = a^2 \sin 2\varphi \\ G = a^2 \sin^4 \theta \sin 2\varphi + a^2 \sin^2 \theta \frac{\cos^2 2\varphi}{\sin 2\varphi} \\ F = a^2 \sin \theta \cos \theta \cos 2\varphi \end{cases} \\ \Rightarrow EG - F^2 &= a^4 \sin^4 \theta\end{aligned}$$

2. 计算下列曲面积分. (1) $\iint_S (x+y+z)dS$, S : 立方体 $0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1$ 的全表面; (2) $\iint_S xyz dS$, S : $x+y+z=1$ 在第一卦限部分; (3) $\iint_S (x^2+y^2)dS$, S : 由 $z=\sqrt{x^2+y^2}$ 和 $z=1$ 所围成的立体表面; (4) $\iint_S (xy+yz+zx)dS$, S : 锥面 $z=\sqrt{x^2+y^2}$ 被柱面 $x^2+y^2=2ax(a>0)$ 所割下的那块曲面; (5) $\iint_S (x^4-y^4+y^2z^2-x^2z^2+1)dS$, S : 圆锥 $z=\sqrt{x^2+y^2}$ 被柱面 $x^2+y^2=2x$ 所截下的部分. (6) $\iint_S \frac{dS}{r^2}$, S : 圆柱面 $x^2+y^2=R^2$ 界于平面 $z=0$ 及 $z=H$ 之间的部分, r 是 S 上的点到原点的距离; (7) $\iint_S |xyz|dS$, S 为曲面 $z=x^2+y^2$ 介于二平面 $z=0$ 和 $z=1$ 间的部分.

解:

$$\begin{aligned}
 I_1 &= 3 \iint_{D_{xy}} (x+y) dx dy + 3 \iint_{D_{xy}} (x+y+1) dx dy \\
 &= 3 \iint_{D_1} dx dy + 12 \iint_{R_1} x dx dy = 3 + 12 \cdot \frac{1}{2} = 9 \\
 I_2 &= \int_0^1 \sqrt{3} dx \int_0^{1-x} xy(1-x-y) dy = \sqrt{3} \int_0^1 \frac{x}{6} (1-x)^3 dx = \frac{\sqrt{3}}{120} \\
 I_3 &= \iint_{D_{xy}} (x^2+y^2) \sqrt{2} dx dy + \iint_{D_1} (x^2+y^2) dx dy = (\sqrt{2}+1) \int_0^{2\pi} \int_0^1 r^3 dr d\theta = \frac{(\sqrt{2}+1)\pi}{2} \\
 I_4 &= \iint_{x^2+y^2 \leq 2ax} \sqrt{2} (xy + x\sqrt{x^2+y^2} + y\sqrt{x^2+y^2}) dx dy \\
 &= \sqrt{2} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} d\theta \int_0^{2a \cos \theta} r^3 (\sin \theta \cos \theta + \sin \theta + \cos \theta) dr \\
 &= 4\sqrt{2}a^4 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} (\sin \theta \cos^5 \theta + \sin \theta \cos^4 \theta + \cos^5 \theta) d\theta = \frac{64\sqrt{2}a^4}{15} \\
 I_5 &= \iint_{x^2+y^2 \leq 2x} \sqrt{2} dx dy = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} d\theta \int_0^{2 \cos \theta} \sqrt{2} r dr = 2\sqrt{2} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos^2 \theta d\theta = \sqrt{2}\pi \\
 I_6 &= \iint_S \frac{dS}{R^2+z^2} = 2 \int_0^H \int_{-R}^R \frac{1}{R^2+z^2} \frac{R}{\sqrt{R^2-y^2}} dy dz = 2\pi \arctan \frac{H}{R} \\
 I_7 &= 4 \iint_{\Sigma_1} xy(x^2+y^2) dS \\
 &= 2 \int_0^1 r^5 \sqrt{1+4r^2} dr = \int_0^1 t^2 \sqrt{1+4t} dt = \frac{125\sqrt{5}-1}{420}
 \end{aligned}$$

3. 计算曲面积分. (1) $\iint_S (x^2+y^2) dS$, $S: x^2+y^2+z^2=R^2$ (2) $\iint_S (x+y+z)dS$, $S: x^2+y^2+z^2=a^2(z \geq 0)$.

$$\begin{aligned}
 \text{解: } I_1 &= \frac{2}{3} \iint (x^2+y^2+z^2) dS = \frac{2}{3} R^2 \cdot S(\Sigma) = \frac{2}{3} R^2 \cdot 4\pi R^2 = \frac{8\pi R^4}{3} \\
 I_2 &= \iint z ds = \iint_{x^2+y^2 \leq a^2} \frac{a}{\sqrt{a^2-x^2-y^2}} \sqrt{a^2-x^2-y^2} dx dy = \pi a^3, a > 0
 \end{aligned}$$

4. 设 G 是平面 $Ax + By + Cz + D = 0 (c \neq 0)$ 上的一个有界闭区域, 它在 Oxy 平面上的投影是 G_1 , 试证

$$\frac{G \text{ 的面积}}{G_1 \text{ 的面积}} = \sqrt{\frac{A^2 + B^2 + C^2}{C^2}}$$

解: G_1 内一点 (u, v) , 对应 G 内一点 $(u, v, \frac{D - Au - Bv}{C})$

$$E = 1 + \frac{A^2}{C^2}, \quad F = \frac{AB}{C^2}, \quad G = 1 + \frac{B^2}{C^2},$$

$$dS = \sqrt{EG - F^2} dS_1 = \sqrt{\frac{A^2 + B^2 + C^2}{C^2}} dS_1$$

$$S(G) = \iint_G dS = \iint_{G_1} \sqrt{\frac{A^2 + B^2 + C^2}{C^2}} dS_1 = \sqrt{\frac{A^2 + B^2 + C^2}{C^2}} S(G_1)$$

□

5. 求抛物面壳 $z = \frac{1}{2}(x^2 + y^2) (0 \leq z \leq 1)$ 的质量, 其各点的密度为 $\rho = z$.

$$\begin{aligned} \text{解: } m_{\text{抛物面壳}} &= \iint_{\Sigma} \rho dS = \frac{1}{2} \iint_{D_{xy}} (x^2 + y^2) \sqrt{1 + x^2 + y^2} dx dy \\ &= \frac{1}{2} \int_0^{2\pi} d\theta \int_0^{\sqrt{2}} r^2 \sqrt{1 + r^2} dr = \frac{\pi}{2} \int_0^2 t \sqrt{1 + t} dt \\ &= \frac{\pi}{2} \int_1^3 \left(u^{\frac{3}{2}} - u^{\frac{1}{2}} \right) du = \frac{2\pi}{15} (6\sqrt{3} + 1) \end{aligned}$$

6. 一个半径为 R 的均匀球壳 (密度为 ρ) 绕其直径旋转, 求它的转动惯量.

解:

$$I_z = \iint_s (x^2 + y^2) \rho dS = \frac{2}{3} \iint (x^2 + y^2 + z^2) \rho dS = \frac{8\pi\rho R^4}{3} = \frac{2}{3} MR^2$$

7. 一个密度为 ρ 的均匀截锥面 $z = \sqrt{x^2 + y^2} (0 < a \leq z \leq b)$, 求它对于处在锥顶的质量为 m 的质点的引力.

解:

$$\begin{aligned} F_x &= F_y = 0 \\ F_z &= \int_0^{2\pi} \int_a^b \frac{Gm\rho}{2r} dr d\theta = \pi Gm\rho \ln \frac{b}{a}. \end{aligned}$$

11.3 习题 向量场在曲线上的积分

1. 计算下列第二型曲线积分. (1) $\int_L (x^2 + y^2) dx + (x^2 - y^2) dy$, L 是曲线 $y = 1 - |1 - x|$ 从点 $(0,0)$ 到点 $(2,0)$; (2) $\int_L \frac{dx+dy}{|x|+|y|}$, L 是沿正方形 $A(1,0), B(0,1), C(-1,0), D(0,-1)$ 逆时针一周的路径; (3) $\int_L \frac{-x dx + y dy}{x^2 + y^2}$, L 是圆周 $x^2 + y^2 = a^2$, 依逆时针方向一周的路径; (4) $\int_L y^2 dx + xy dy + xz dz$, L 是从 $O(0,0,0)$ 到 $A(1,0,0)$ 再到 $B(1,1,0)$ 最后到 $C(1,1,1)$ 的折线段; (5) $\int_L e^{x+y+z} dx + e^{x+y+z} dy + e^{x+y+z} dz$, L 是 $x = \cos \varphi, y = \sin \varphi, z = \frac{\varphi}{\pi}$ 从点 $A(1,0,0)$ 到点 $B(0,1,\frac{1}{2})$; (6) $\int_L y dx + z dy + x dz$, L 是 $x + y = 2$ 与 $x^2 + y^2 + z^2 = 2(x + y)$ 的交线, 从原点看去是顺时针方向.

解:

$$\begin{aligned}
 I_1 &= \int_0^1 (x^2 + x^2) dx + \int_1^2 [x^2 + (2-x)^2 - (x^2 - (2-x)^2)] dx \\
 &= \int_0^1 2x^2 dx + 2 \int_1^2 (4 - 4x + x^2) dx \\
 &= \frac{2}{3} + 2 \left(4x - 2x^2 + \frac{x^3}{3} \right) \Big|_1^2 = \frac{4}{3} \\
 I_2 &= 0 \quad \left(P, Q = 1, \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y} \right) \\
 I_3 &= \frac{1}{a^2} \int_0^{2\pi} [-a \cos \theta (-a \sin \theta) + a \sin \theta a \cos \theta] d\theta = \int_0^{2\pi} \sin 2\theta d\theta = 0 \\
 I_4 &= \int_{L_1+L_2+L_3} = \int_{L_1} y^2 dx + \int_{L_2} xy dy + \int_{L_3} xz dz = 0 + \int_0^1 y dy + \int_0^1 z dz = 1 \\
 I_5 &= \int_0^{\frac{\pi}{2}} e^{\sin \varphi + \cos \varphi + \frac{\varphi}{\pi}} \left(\cos \varphi - \sin \varphi + \frac{1}{\pi} \right) d\varphi \\
 &= \int_1^{\frac{3}{2}} e^{\sin \varphi + \cos \varphi + \frac{\varphi}{\pi}} d \left(\sin \varphi + \cos \varphi + \frac{\varphi}{\pi} \right) = e^{\frac{3}{2}} - e \\
 I_6 &= \int_0^{2\pi} ((1 + \cos \theta) \sin \theta + \sqrt{2} \sin \theta (-\sin \theta) + (1 - \cos \theta) \sqrt{2} \cos \theta) d\theta \\
 &= \int_0^{2\pi} \left(\sin \theta + \frac{1}{2} \sin 2\theta + \sqrt{2} \cos \theta - \sqrt{2} \right) d\theta = -2\sqrt{2}\pi
 \end{aligned}$$

2. 求向量场 $v = (y+z)\mathbf{i} + (z+x)\mathbf{j} + (x+y)\mathbf{k}$ 沿曲线 $L: x = a \sin^2 t, y = 2a \sin t \cos t, z = a \cos^2 t (0 \leq t \leq \pi)$ 参数增加方向的曲线积分.

解:

$$\begin{aligned}
 I &= \int_L \mathbf{v} \cdot d\mathbf{r} = \int_L (y+z)dx + (z+x)dy + (x+y)dz \\
 &= \int_0^\pi (2a \sin t \cos t + a \cos^2 t) \cdot 2a \sin t \cos t + a \cdot 2a \cos 2t + (a \sin^2 t + 2a \sin t \cos t) (-2a \cos t \sin t) dt \\
 &= a^2 \int_0^\pi (\cos 2t \sin 2t + 2 \cos 2t) dt = 0
 \end{aligned}$$

3. 设一质点处于弹性力场中, 弹力方向指向原点, 大小与质点离原点的距离成正比, 比例系数为 k , 若质点沿椭圆 $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ 从点 $(a, 0)$ 移到点 $(0, b)$, 求弹性力所做的功.

解:

$$\begin{aligned} x &= a \cos t, y = b \sin t, t \in \left[0, \frac{\pi}{2}\right], \mathbf{F} = -k(x\mathbf{i} + y\mathbf{j}) \\ I &= \int_L -(kxdx + kydy) = \int_0^{\frac{\pi}{2}} (-ka^2 \cos t d \cos t - kb^2 \sin t d \sin t) \\ &= -\frac{a^2 k}{2} \cos^2 t \Big|_0^{\frac{\pi}{2}} - \frac{b^2 k}{2} \sin^2 t \Big|_0^{\frac{\pi}{2}} = \frac{k}{2} (a^2 - b^2) \end{aligned}$$

4. 利用 Green 公式, 计算下列曲线积分. (1) $\oint_L (x+y)^2 dx + (x^2 - y^2) dy$, L 是顶点为 $A(1, 1), B(3, 3), C(3, 5)$ 的三角形的周界, 沿反时针方向; (2) $\oint_L (xy + x + y)dx + (xy + x - y)dy$, L 是椭圆 $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ 沿顺时针方向; (3) $\oint_L (yx^3 + e^y) dx + (xy^3 + xe^y - 2y) dy$, L 是对称于两坐标轴的闭曲线; (4) $\oint_L \sqrt{x^2 + y^2} dx + y \left[xy + \ln \left(x + \sqrt{x^2 + y^2} \right) \right] dy$, L 是 $y^2 = x - 1$ 与 $x = 2$ 围成的封闭曲线沿逆时针方向; (5) $\int_{AMB} (x^2 + 2xy - y^2) dx + (x^2 - 2xy + y^2) dy$, L 是从点 $A(0, -1)$ 沿直线 $y = x - 1$ 到点 $M(1, 0)$, 再从 M 沿圆周 $x^2 + y^2 = 1$ 到点 $B(0, 1)$; (6) $\int_{AMO} (e^x \sin y - my) dx + (e^x \cos y - m) dy$, 其中 AMO 为由点 $A(a, 0)$ 到点 $O(0, 0)$ 的上半圆周 $x^2 + y^2 = ax (a > 0)$

解:

$$\begin{aligned} I_1 &= \iint_S [2x - (2x + 2y)] d\sigma = \iint_S -2y d\sigma \\ &= \int_1^3 dx \int_x^{2x-1} -2y dy = \int_1^3 (-3x^2 + 4x - 1) dx = -12 \\ I_2 &= -\iint_S \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dxdy = -\iint_S ((y+1) - (x+1)) dxdy \\ &= \iint_S (x - y) dxdy = 0 \\ I_3 &= \iint_S (y^3 + e^y - x^3 - e^y) d\sigma = \iint_S (y^3 - x^3) d\sigma = 0 \\ I_4 &= \iint_S \left[y \left(y + \frac{1}{\sqrt{x^2 + y^2}} \right) - \frac{y}{\sqrt{x^2 + y^2}} \right] d\sigma = \iint_S y^2 d\sigma \\ &= \int_{-1}^1 dy \int_{y^2+1}^2 y^2 dx = \int_{-1}^1 y^2 (1 - y^2) dy = \frac{4}{15} \\ I_5 &= I_{AMBA} - I_{BA} = 0 - \int_1^{-1} y^2 dy = \frac{2}{3} \\ I_6 &= \iint_S \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) d\sigma - 0 = \iint_S m dxdy = \frac{\pi ma^2}{8} \end{aligned}$$

5. 利用曲线积分计算下列区域的面积. (1) 星形线 $x = a \cos^3 t, y = a \sin^3 t (0 \leq t \leq 2\pi)$ 围成的区域; (2) 摆线 $x = a(t - \sin t), y = a(1 - \cos t) (0 \leq t \leq 2\pi)$ 与 Ox 轴所围成的区域.

解: 由 Green 公式知

$$\begin{aligned} (1) S_1 &= \frac{1}{2} \oint_{\partial D} (-y dx + x dy) \\ &= \frac{3a^2}{2} \int_0^{2\pi} \sin^2 t \cos^2 t dt = \frac{3\pi a^2}{8} \\ (2) S_2 &= \frac{1}{2} \oint_{\partial D} (-y dx + x dy) \\ &= -\frac{a^2}{2} \int_0^{2\pi} [\sin t(t - \sin t) - (1 - \cos t)^2] dt + 0 = 3\pi a^2 \end{aligned}$$

6. 计算曲线积分 $\int_L \frac{-y dx + x dy}{x^2 + y^2}$.

(1) L 为从点 $A(-a, 0)$ 沿圆周 $y = \sqrt{a^2 - x^2}$ 到点 $B(a, 0), a > 0$; (2) L 为从点 $A(-1, 0)$ 沿抛物线 $y = 4 - (x - 1)^2$ 到点 $B(3, 0)$.

解 (1) 记 $x = a \cos \theta, y = a \sin \theta$, 则

$$\int_{L_1} \frac{-y dx + x dy}{x^2 + y^2} = \int_{\pi}^0 \frac{-a \sin \theta \cdot (-a \sin \theta) + a \cos \theta \cdot a \cos \theta}{a^2} d\theta = \int_{\pi}^0 d\theta = -\pi.$$

(2) 取 $a = \frac{1}{2}, D$: 由 $L_1, L_2, y = 0$ 围成的区域, 则 $\partial D = (-L_2) + \vec{AC} + L_1 + \vec{DB}$, 其中 $C(-\frac{1}{2}, 0), D(\frac{1}{2}, 0)$. 记

$$\begin{aligned} P &= -\frac{y}{x^2 + y^2}, \quad Q = \frac{x}{x^2 + y^2} \\ \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} &= \frac{y^2 - x^2}{(x^2 + y^2)^2} + \frac{x^2 - y^2}{(x^2 + y^2)^2} = 0 \end{aligned}$$

由 Green 公式知,

$$\begin{aligned} \int_{\partial D} P dx + Q dy &= \left(\int_{-L_2} + \int_{AC} + \int_{L_1} + \int_{DB} \right) P dx + Q dy = 0 \\ \Rightarrow \int_{L_2} P dx + Q dy &= \left(\int_{AC} + \int_{L_1} + \int_{DB} \right) P dx + Q dy = \int_{L_1} P dx + Q dy = -\pi \end{aligned}$$

7. 设 D 是平面上由简单闭曲线 L 围成的区域. (1) 如果 $f(x, y)$ 有连续的二阶导数, 证明 $\oint_L \frac{\partial f}{\partial n} ds = \iint_D \Delta f dx dy$, 这里 $\mathbf{n}$ 是曲线 L 的单位外法向量, $\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$ 称为二维的 Laplace 算子. 因此, 当 f 满足 Laplace 方程 $\Delta f = 0$ 时, 有 $\oint_L \frac{\partial f}{\partial n} ds = 0$. (提示: 设单位外法向量为 $\mathbf{n} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j}$, 则平面曲线 L 指向逆时针方向的单位切向量为 $\boldsymbol{\tau} = -\cos \beta \mathbf{i} + \cos \alpha \mathbf{j}$) (2) 如果 $\mathbf{a}$ 是单位常值向量, 证明: $\oint \cos(\mathbf{a}, \mathbf{n}) ds = 0$ (3) 如果 $u(x, y), v(x, y)$ 有连续的二阶导数, 证明下列第二 Green 公式: $\oint_L (v \frac{\partial u}{\partial n} - u \frac{\partial v}{\partial n}) ds = \iint_D (v \Delta u - u \Delta v) dx dy$

证明 (1) 设平面曲线 ∂D 的外法向量为 $\mathbf{n} = \cos \alpha \mathbf{i} + \sin \alpha \mathbf{j}$, 那么 ∂D 的切向量 $\boldsymbol{\tau} = -\sin \alpha \mathbf{i} + \cos \alpha \mathbf{j}$ 且 $\boldsymbol{\tau}$ 的方向指向曲线 ∂D 的逆时针方向. 因此

$$\begin{aligned}\oint_{\partial D} \frac{\partial f}{\partial \mathbf{n}} ds &= \oint_{\partial D} \nabla f \cdot \mathbf{n} ds = \oint_{\partial D} \left(\frac{\partial f}{\partial x} \cos \alpha + \frac{\partial f}{\partial y} \sin \alpha \right) ds \\ &= \oint_{\partial D} \frac{\partial f}{\partial x} dy - \frac{\partial f}{\partial y} dx\end{aligned}$$

所以, 利用 Green 定理就有

$$\oint_{\partial D} \frac{\partial f}{\partial \mathbf{n}} ds = \oint_{\partial D} -\frac{\partial f}{\partial y} dx + \frac{\partial f}{\partial x} dy = \iint_D \Delta f dx dy.$$

(2) 设 $\mathbf{a} = a_1 \mathbf{i} + a_2 \mathbf{j}$ 为平面单位常向量. 令 $f(x, y) = a_1 x + a_2 y$, 则

$$\nabla f = \mathbf{a}, \quad \Delta f = 0, \quad \frac{\partial f}{\partial \mathbf{n}} = \nabla f \cdot \mathbf{n} = \mathbf{a} \cdot \mathbf{n} = \cos(\mathbf{a}, \mathbf{n}),$$

由 (1) 的结果就得到 $\oint_{\partial D} \cos(\mathbf{a}, \mathbf{n}) ds = 0$

(3) 类似 (1) 中的推导, 并利用 Green 定理, 有

$$\begin{aligned}\oint_{\partial D} v \frac{\partial u}{\partial \mathbf{n}} ds &= \oint_{\partial D} v \mathbf{k} \times \nabla u \cdot d\mathbf{r} = \oint_{\partial D} -v \frac{\partial u}{\partial y} dx + v \frac{\partial u}{\partial x} dy \\ &= \iint_D \frac{\partial}{\partial x} \left(v \frac{\partial u}{\partial x} \right) + \frac{\partial}{\partial y} \left(v \frac{\partial u}{\partial y} \right) dx dy \\ &= \iint_D \left[v \Delta u + \left(\frac{\partial v}{\partial x} \right) \left(\frac{\partial u}{\partial x} \right) + \left(\frac{\partial v}{\partial y} \right) \left(\frac{\partial u}{\partial y} \right) \right] dx dy\end{aligned}$$

同理有
$$\oint_{\partial D} u \frac{\partial v}{\partial \mathbf{n}} ds = \iint_D \left[u \Delta v + \left(\frac{\partial u}{\partial x} \right) \left(\frac{\partial v}{\partial x} \right) + \left(\frac{\partial u}{\partial y} \right) \left(\frac{\partial v}{\partial y} \right) \right] dx dy$$

两式相减得
$$\oint_{\partial D} \left(v \frac{\partial u}{\partial \mathbf{n}} - u \frac{\partial v}{\partial \mathbf{n}} \right) ds = \iint_D (v \Delta u - u \Delta v) dx dy. \quad \square$$

法向量 $\mathbf{n}$ 与切向量 $\boldsymbol{\tau}$ 关系图

11.4 习题 向量场在曲面上的积分

1. 计算下列第二型曲面积分. (1) $\iint_S (x + y^2 + z) dx dy$, S 为椭球面 $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ 的外侧. (2) $\iint_S xyz dx dy$, S 是柱面 $x^2 + z^2 = R^2$ 在 $x \geq 0, y \geq 0$ 两卦限内被平面 $y = 0$ 及 $y = h$ 所截下部分的外侧; (3) $\iint_S xy^2 z^2 dy dz$, S 为球面 $x^2 + y^2 + z^2 = R^2$ 的 $x \leq 0$ 的一半远离球心一侧; (4) $\iint_S yz dz dx$, S 为球面 $x^2 + y^2 + z^2 = 1$ 的上半部分 ($z \geq 0$) 并取外侧; (5) $\iint_S x^2 dy dz + y^2 dz dx + z^2 dx dy$, S 为平面 $x + y + z = 1$ 在第一卦限的部分, 远离原点的一侧; (6) $\iint_S (y - z) dy dz + (z - x) dz dx + (x - y) dx dy$, S 是圆锥面 $x^2 + y^2 = z^2$ ($0 \leq z \leq 1$) 的下侧; (7) $\iint_S xz^2 dy dz + x^2 y dz dx + y^2 z dx dy$, S 是通过上半球面 $z = \sqrt{a^2 - x^2 - y^2}$ 的上侧; (8) $\iint_S f(x) dy dz + g(y) dz dx + h(z) dx dy$, 其中 $f(x), g(y), h(z)$ 为连续函数, S 为直角平行六面体 $0 \leq x \leq a, 0 \leq y \leq b, 0 \leq z \leq c$ 的外侧.

解:

$$(1) \quad \because I_2 = \iint_S y^2 dx dy = \iint_{S_1} y^2 dx dy + \iint_{S_2} y^2 dx dy = 0, (S_1, S_2 \text{ 分居 } X_oY \text{ 平面上下侧})$$

$$I_1 = \iint_S x dx dy = \iint_{S_3} x dx dy + \iint_{S_4} x dx dy \xrightarrow{S_3, S_4 \text{ 为前后面, } X_oY \text{ 投影为 } 0} 0$$

$$\begin{aligned} I_3 &= \iint_S z dx dy = \iint_{S_1} z dx dy + \iint_{S_2} z dx dy \\ &= \iint_D c \sqrt{1 - \left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)} dx dy - \iint_D -c \sqrt{1 - \left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)} dx dy \\ &= 2c \iint_D \sqrt{1 - \frac{x^2}{a^2} + \frac{y^2}{b^2}} dx dy = 2c \int_0^{2\pi} \int_0^1 \sqrt{1 - r^2} ab r dr d\theta \\ &= 4c\pi ab \int_0^1 \sqrt{1 - r^2} dr = 4\pi abc \cdot \frac{1}{3} = \frac{4\pi abc}{3} \end{aligned}$$

$$\begin{aligned} (2) \quad I &= \iint_{\Sigma_4} xyz dx dy = \int_R^{-R} \int_0^h \sqrt{R^2 - z^2} yz \, d\sqrt{R^2 - z^2} dy \\ &= \int_R^{-R} \int_0^h -z^2 y dz dy = \frac{2R^3}{3} \cdot \frac{h^2}{2} = \frac{R^3 h^2}{3}. \end{aligned}$$

$$\begin{aligned} (3) \quad I &= \iint_S xy^2 z^2 dy dz = \iint_D xy^2 (R^2 - x^2 - y^2) dy dz \\ &= \iint_D r^4 (R^2 - r^2) \cos \theta \sin^2 \theta dr d\theta = \int_0^{2\pi} \cos \theta \sin^2 \theta d\theta \int_0^R r^4 (R^2 - r^2) dr \\ &= \frac{2\pi R^7}{105} \end{aligned}$$

$$(4) \text{ 设 } x = \sin \theta \cos \varphi, \quad y = \sin \theta \sin \varphi, \quad z = \cos \theta, \quad \frac{\partial(z, x)}{\partial(\theta, \varphi)} = \sin^2 \theta \sin \varphi$$

$$I = \iint_S yz dx dz = \int_0^{\frac{\pi}{2}} d\theta \int_0^{2\pi} \sin^3 \theta \cos \theta \sin^2 \varphi d\varphi = \frac{\pi}{4}$$

$$\begin{aligned}
 (5) \quad I_1 &= \int_0^1 \int_0^{1-z} (1-y-z)^2 dy dz \\
 &= \int_0^1 dz \int_0^{1-z} [(1-z)^2 - 2y(1-z) + y^2] dy = \int_0^1 (1-z)^3 - (1-z)^3 + \frac{(1-z)^3}{3} dz = \frac{1}{12} \\
 I &= I_1 + I_2 + I_3 = 3I_1 = \frac{1}{4}
 \end{aligned}$$

$$\begin{aligned}

 I_3 &= \iint_s (x-y) dx dy = \int_0^{2\pi} d\theta \int_0^1 (z \cos \theta - z \sin \theta) z dz = 0 \\
 I &= I_1 + I_2 + I_3 = 0
 \end{aligned}$$

$$(7) \quad \nabla \cdot \mathbf{F} = x^2 + y^2 + z^2. \text{ 用圆盘 } z=0 \text{ 封闭上半球; 圆盘上的通量为零.}$$

$$I = \iiint_{x^2+y^2+z^2 \leq a^2, z \geq 0} (x^2 + y^2 + z^2) dV = 2\pi \int_0^a r^4 dr = \frac{2\pi a^5}{5}.$$

$$(8) S = S_1 + S_2 + S_3 + S_4 + S_5 + S_6;$$

$$S_1, S_2: x=0, \quad x=a, \quad dx dz = 0, \quad dx dy = 0,$$

$$S_3, S_4: y=0, \quad y=b, \quad dy dz = 0, \quad dz dx = 0,$$

$$S_5, S_6: z=0, \quad z=c, \quad dx dz = 0, \quad dz dy = 0,$$

$$\oiint_s f(x, y) dy dz = (-1) \int_0^c \int_0^b f(0) dy dz + \int_0^c \int_0^b f(a) dy dz = bc(f(a) - f(0))$$

$$\text{由对称性, } I = bc(f(a) - f(0)) + ac(g(b) - g(0)) + ab(h(c) - h(0))$$

2. 求场 $\mathbf{v} = (x^3 - yz)\mathbf{i} - 2x^2y\mathbf{j} + z\mathbf{k}$ 通过长方体 $0 \leq x \leq a, 0 \leq y \leq b, 0 \leq z \leq c$ 的外侧面 S 的通量.

$$\nabla \cdot \mathbf{v} = 3x^2 - 2x^2 + 1 = x^2 + 1,$$

$$\begin{aligned}
 \Phi &= \oiint_S \mathbf{v} \cdot \mathbf{n} dS = \iiint_V (x^2 + 1) dV \\
 &= bc \int_0^a (x^2 + 1) dx = \frac{1}{3} a^3 bc + abc.
 \end{aligned}$$

11.5 习题 Gauss/Stokes 定理

1. 计算下列曲面积分

(1) $\iint_S (x+1)dy dz + y dz dx + (xy+z)dx dy$, S 是以 $O(0,0,0), A(1,0,0), B(0,1,0), C(0,0,1)$ 为顶点的四面体的外表面; (2) $\iint_S xy dy dz + yz dz dx + zx dx dy$, S 是由 $x=0, y=0, z=0, x+y+z=1$ 所围成的四面体的外侧表面; (3) $\iint_S x^2 dy dz + y^2 dz dx + z^2 dx dy$, S 是球面 $(x-a)^2 + (y-b)^2 + (z-c)^2 = R^2$ 的外侧; (4) $\iint_S xy^2 dy dz + yz^2 dz dx + zx^2 dx dy$, S 是球面 $x^2 + y^2 + z^2 = z$ 的外侧; (5) $\iint_S (x-z)dy dz + (y-x)dz dx + (z-y)dx dy$, S 是旋转抛物面 $z = x^2 + y^2 (0 \leq z \leq 1)$ 的下侧; (6) $\iint_S (y^2 + z^2) dy dz + (z^2 + x^2) dz dx + (x^2 + y^2) dx dy$, S 是上半球面 $x^2 + y^2 + z^2 = a^2 (z \geq 0)$ 的上侧

解:

$$I_1 = 3 \iiint_V dV = \iiint_V (1+1+1)dV = \frac{1}{2}$$

$$I_2 = \iiint_V (x+y+z)dV = \int_0^1 t d\left(\frac{1}{6}t^3\right) = \frac{1}{8}$$

$$I_3 = \iiint_V 2(x+y+z)dxdydz$$

$$= 2 \int_0^{2\pi} \int_0^\pi \int_0^R (a+b+c+r(\sin\theta\cos\varphi + \sin\theta\sin\varphi + \cos\theta))r^2 \sin\theta dr d\theta d\varphi = \frac{8}{3}(a+b+c)\pi R^3$$

$$I_4 = \iiint_V (x^2 + y^2 + z^2) dV = \int_0^{2\pi} d\varphi \int_0^{\frac{\pi}{2}} d\theta \int_0^{\cos\theta} r^4 \sin\theta dr = \frac{\pi}{15}$$

对于 (5)(6), 需要补面后用 Gauss

$\Sigma_{0^5} = \{(x, y, z) \mid x^2 + y^2 \leq 1, z = 1\}$ 取上侧

$$\iint_{\Sigma_{0^5}+S} = 3 \iiint_V dV = 3 \int_0^1 dz \int_0^{\sqrt{z}} dr \int_0^{2\pi} r d\theta = 3\pi \int_0^1 z dz = \frac{3\pi}{2}$$

$$\iint_{\Sigma_{0^5}} = \iint (1-y)dxdy = \int_0^{2\pi} d\theta \int_0^1 (1-r\sin\theta)rdr = \pi I_5 = \iint_{\Sigma_{0^5}+S} - \iint_{\Sigma_{0^5}} = \frac{\pi}{2}$$

$\Sigma_{0^6} = \{(x, y, z) \mid x^2 + y^2 \leq a^2, z = 0\}$ 取下侧

$$\iint_{\Sigma_{0^6}} = \int_0^a \int_0^{2\pi} -r^2 r dr d\theta = -\frac{\pi a^4}{2}, \iint_{\Sigma_{0^6}+S} = \iiint_V 0 dV = 0$$

$$I_6 = \iint_{\Sigma_{0^6}+S} - \iint_{\Sigma_{0^6}} = \frac{\pi a^4}{2}$$

2 求引力场 $\mathbf{F} = -km\frac{\mathbf{r}}{r^3}$ 通过下列闭曲面外侧的通量: (1) 空间中任一包围质量 m (在原点) 的闭曲面; (2) 空间中任一不包围质量 m 的闭曲面; (3) 质量 m 在光滑的闭曲面上.

解:

(1) $\Sigma_0^+ : x^2 + y^2 + z^2 \leq \varepsilon^2$ 外, $O(0,0,0)$ 是 P, Q, R 奇点

$$\Omega : \oint_{\Sigma + \Sigma_0} = \iiint (\nabla \cdot \mathbf{F}) dV = 0$$

$$\oint_{\Sigma} = \oint_{\Sigma_0^+} = \oint_{\Sigma} - \frac{km}{r^3} \frac{\mathbf{r} \cdot \mathbf{r}}{\varepsilon} ds = -4\pi km.$$

(2) $O(0,0,0) \notin \Sigma$, $\oint \mathbf{F} \cdot \mathbf{n} ds = 0$ (3) $\mathbf{F}$ 在质量所在点奇异, 故通常意义下的曲面积分不存在。若规定对称主值 (等价于取半立体角), 则通量为 $-2\pi km$ 。

3. 设区域 V 是由曲面 $x^2 + y^2 - \frac{z^2}{2} = 1$ 及平面 $z = 1, z = -1$ 围成, S 为 V 的全表面外伸, 又设 $\mathbf{V} = (x^2 + y^2 + z^2)^{-\frac{3}{2}} (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})$. 求积分 $\iint_S \frac{x dy dz + y dz dx + z dx dy}{\sqrt{(x^2 + y^2 + z^2)^3}}$.

解:

$$I = \iint_S \frac{xdydz + ydzdx + zdxdy}{(x^2 + y^2 + z^2)^{\frac{3}{2}}}, v = \left(\frac{x}{r^3}, \frac{y}{r^3}, \frac{z}{r^3} \right)$$

对于 v 在 $(0,0,0)$ 偏导数不存在, 作 $x^2 + y^2 + z^2 < \varepsilon^2 (\varepsilon > 0)$ 挖去一个球, 球外侧为 Σ_0^+

$$\iint_{\partial\Omega = S + \Sigma_0^-} Pdydz + Qdzdx + Rdxdy = \iiint_{\Omega} \left(\frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} \right) dV = 0 (\Omega \text{ 是球外 } S \text{ 内区域})$$

$$I = \oint_{S + \Sigma_0^-} - \oint_{\Sigma_0^-} = \oint_{\Sigma_0^+} = \frac{1}{\varepsilon^3} \oint_{x^2 + y^2 + z^2 = \varepsilon^2} xdydz + ydzdx + zdxdy = \frac{\frac{4}{3}\pi\varepsilon^3}{\varepsilon^3} = 4\pi$$

4. 设对于半空间 $x > 0$ 内任意的光滑有向封闭曲面 S , 都有 $\oint_S xf(x)dy dz - xyf(x)dz dx - e^{2x}z dx dy = 0$ 其中函数 $f(x)$ 在 $(0, +\infty)$ 内具有连续的一阶导数, 且 $\lim_{x \rightarrow 0^+} f(x) = 1$, 求 $f(x)$.

解:

$$\begin{aligned}
 & \oint_S xf(x)dydz - xyf(x)dzdx - e^{2x}zdx dy = 0 \\
 \xLeftrightarrow{\text{Gauss}} & \iiint_{\Omega} (f(x) + xf'(x) - xf(x) - e^{2x}) dV = 0 \\
 & \therefore f(x) + xf'(x) - xf(x) - e^{2x} = 0 \\
 \Leftrightarrow & (1-x)f(x) + xf'(x) = e^{2x} \\
 \Leftrightarrow & (xe^{-x}f(x))' = e^x \\
 \therefore & xe^{-x}f(x) = e^x + C, \text{ 且 } f(x) = \frac{e^{2x} + Ce^x}{x}. \\
 \lim_{x \rightarrow 0^+} f(x) = 1 & \text{ 要求 } C = -1, \quad f(x) = \frac{e^{2x} - e^x}{x}.
 \end{aligned}$$

5. 证明任意光滑闭曲面 S 围成的立体体积可以表成 $V = \frac{1}{3} \oint_S x dy dz + y dz dx + z dx dy$ 其中积分沿 S 的外侧进行.

证明 令 $\mathbf{v} = (x, y, z) \therefore \nabla \cdot \mathbf{v} = 3$, 由 Gauss 定理,

$$\begin{aligned}
 \iint_S \mathbf{v} \cdot d\mathbf{S} &= \iiint_D \nabla \cdot \mathbf{v} dV = \iiint_D 3 dV = 3V \\
 V &= \frac{1}{3} \iint_S \mathbf{v} \cdot d\mathbf{S} = \frac{1}{3} \oint_S x dy dz + y dz dx + z dx dy
 \end{aligned}$$

□

6. 证明 Archimedes(阿基米德, 公元前 287 ~ 前 212) 原理: 物体 V 全部浸入液体中所受的浮力等于与物体同体积的液体的重量. (提示: 设液体的密度为常数 ρ , 给出物体表面每一小块 dS 所受到的压力, 通过积分计算 ∂V 的压力.)

证明 取坐标系如图所示. 设液体的密度为 ρ , 那么物体表面一小块面积 dS 所受到的压力大小是 $\rho g z dS$, 方向是 $-\mathbf{n}$, 这里 $\mathbf{n}$ 是物体表面的单位外法向量.

设 $\mathbf{n} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$, 作为物体 V 的表面的曲面记为 S , 那么整个物体受到的压

力 $\mathbf{F} = -\int_S \rho g z \cos \alpha dS \mathbf{i} - \int_S \rho g z \cos \beta dS \mathbf{j} - \int_S \rho g z \cos \gamma dS \mathbf{k}$ 由 Gauss 定理, 可得

$$\begin{aligned}\int_S \rho g z \cos \alpha dS &= \iiint_V \frac{\partial(\rho g z)}{\partial x} dx dy dz = 0, \\ \int_S \rho g z \cos \beta dS &= \iiint_V \frac{\partial(\rho g z)}{\partial y} dx dy dz = 0, \\ \int_S \rho g z \cos \gamma dS &= \iiint_V \frac{\partial(\rho g z)}{\partial z} dx dy dz = \rho g \iiint_V dx dy dz = \rho g V.\end{aligned}$$

由此得 $\mathbf{F} = -\rho g V \mathbf{k}$. □

7. 设 c 是常向量, S 是任意的光滑闭曲面, 证明: $\iint_S \cos(\widehat{c, n}) dS = 0$. 其中 $(\widehat{c, n})$ 表示向量 c 与曲面法向量 n 的夹角.

证明 设 $c \neq 0$, 并记 $\widehat{c} = c/|c|$. 取 n 为曲面 S 的单位外法向量, 由 Gauss 定理:

$$\iint_S \cos(\widehat{c, n}) dS = \iint_S \widehat{c} \cdot n dS = \iiint_V \nabla \cdot \widehat{c} dV = 0.$$

□

8. 设 L 是 xy 平面上光滑的简单闭曲线, 逆时针方向, 立体 V 是柱体, 它以 L 为准线, 以 L 在 xy 平面内所围平面区域 D 为底, 侧面是母线平行于 z 轴的柱面, 高为 1, 试写出向量场 $v = P\mathbf{i} + Q\mathbf{j}$ 在 V 上的 Gauss 公式, 并由此来证明 Green 公式.

证明: 令 $w = (Q, -P, 0)$. 柱体上下底面的通量均为零, 而侧面外法向量满足 $n dS = (dy, -dx, 0) dz$, 故

$$\begin{aligned}\oint_L (P dx + Q dy) &= \oiint_{\partial V} w \cdot n dS = \iiint_V \nabla \cdot w dV \\ &= \iint_D \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy,\end{aligned}$$

□

9. 计算下列曲线积分. (1) $\oint_L y dx + z dy + x dz$, L 是顶点为 $A(1, 0, 0), B(0, 1, 0), C(0, 0, 1)$ 的三角形边界, 从原点看去, L 沿顺时针方向; (2) $\oint_L (y - z) dx + (z - x) dy + (x - y) dz$, L 是圆柱面 $x^2 + y^2 = a^2$ 和平面 $\frac{x}{a} + \frac{z}{h} = 1 (a > 0, h > 0)$ 的交线, 从 x 轴的正方向看来, L 沿反时针方向; (3) $\oint_L (y^2 - z^2) dx + (z^2 - x^2) dy + (x^2 - y^2) dz$, L 是平面 $x + y + z = \frac{3}{2}a$ 与立方体 $0 \leq x \leq a, 0 \leq y \leq a, 0 \leq z \leq a$ 表面的交线从 z 轴正向看来, L 沿反时针方向; (4) $\oint_L y^2 dx + xy dy + xz dz$, L 是圆柱面 $x^2 + y^2 = 2y$ 与平面 $y = z$ 的交线; (5) $\oint_L (y^2 - y) dx + (z^2 - z) dy + (x^2 - x) dz$, L 是球面 $x^2 + y^2 + z^2 = a^2$ 与平面 $x + y + z = 0$ 的交线, L 的方向与 z 轴正向成右手系; (6) $\oint_L (y^2 - z^2) dx + (2z^2 - x^2) dy + (3x^2 - y^2) dz$, 其中 L 是平面 $x + y + z = 2$ 与柱面 $|x| + |y| = 1$ 的交线, 从 z 轴正向看去, L 为逆时针方向.

解:

$$\begin{aligned}
 \vec{v} &= (y, z, x), \nabla \times \vec{v} = (-1, -1, -1), \vec{n} = \frac{1}{\sqrt{3}}(1, 1, 1) \\
 I_1 &= \oint_L \vec{v} \cdot d\vec{r} = \iint_{\Sigma} -\sqrt{3}dS = -\frac{3}{2} \\
 I_2 &= -2 \iint_{\Sigma} dydz + dzdx + dxdy \\
 &= -2 \iint_{\Sigma} \frac{a+h}{\sqrt{a^2+h^2}}dS = -2\pi a(a+h) \\
 I_3 &= \iint_{D_{xy}} -6a \, dx \, dy = -6a \cdot \frac{3a^2}{4} = -\frac{9}{2}a^3 \\
 I_4 &= \iint_{\Sigma} (0, -z, -y) \cdot \vec{n} \, dS = 0 \quad (y=z) \\
 I_5 &= \iint_{\Sigma} \sqrt{3}dS = \sqrt{3}\pi a^2 \\
 I_6 &= \iint_{\Sigma} -\frac{2}{\sqrt{3}}(4x+2y+3z)dS = \iint_{D_{xy}} -2(6+x-y)dxdy = -24
 \end{aligned}$$

10. 在积分 $\oint_L x^2y^3 \, dx + dy + z \, dz$ 中, 路径 L 是 Oxy 平面上正向的圆 $x^2+y^2=R^2, Z=0$; 利用 Stokes 公式化曲线积分为以 L 为边界所围区域 S 上的曲面积分. (1) S 取 Oxy 平面上的圆面 $x^2+y^2 \leq R^2$. (2) S 取半球面 $z=\sqrt{R^2-x^2-y^2}$; 结果相同吗?

解: $\mathbf{v} = (x^2y^3, 1, z) \therefore \nabla \times \mathbf{v} = (0, 0, -3x^2y^2)$.

(1) S 的法向量为 $\mathbf{n} = (0, 0, 1)$, Stokes 定理得:

$$\begin{aligned}
 \oint_L \mathbf{v} \cdot d\mathbf{r} &= \iint_S \nabla \times \mathbf{v} \cdot \mathbf{n} dS = \iint_S -3x^2y^2 \, dS, \iint_S -3x^2y^2 \, dS = \iint_D -3r^4 \sin^2 \theta \cos^2 \theta \cdot r \, dr \, d\theta \\
 &= -3 \int_0^R r^5 \, dr \int_0^{2\pi} \left(\frac{1}{2} \sin 2\theta \right)^2 \, d\theta = -\frac{\pi}{8} R^6
 \end{aligned}$$

(2) S 的单位法向量 $\mathbf{n} = \frac{1}{R}(x, y, z)$, Stokes 定理得:

$$\begin{aligned}
 \oint_L \mathbf{v} \cdot d\mathbf{r} &= \iint_S \nabla \times \mathbf{v} \cdot \mathbf{n} dS = -\frac{3}{R} \iint_S x^2y^2z \, dS, \\
 -\frac{3}{R} \iint_S x^2y^2z \, dS &= -\frac{3}{R} \iint_{D_{\theta\varphi}} R^5 \sin^4 \theta \cos^2 \varphi \sin^2 \varphi \cos \theta \cdot R^2 \sin \theta \, d\theta d\varphi \\
 &= -3R^6 \int_0^{\frac{\pi}{2}} \sin^5 \theta d(\sin \theta) \int_0^{2\pi} \sin^2 \varphi \cos^2 \varphi \, d\varphi \\
 &= -3R^6 \cdot \frac{1}{6} \cdot \frac{\pi}{4} = -\frac{\pi}{8} R^6
 \end{aligned}$$

故结果相同。

□

11. 证明常向量场 $\mathbf{c}$ 沿任意光滑闭曲线的环量都等于 0.

证明: $\because \nabla \times \mathbf{c} = \mathbf{0}$, S 是任意光滑闭曲线围成的曲面, $\partial S = L$, Stokes 定理:

$$\oint_L \mathbf{c} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{c} \cdot d\mathbf{S} = 0$$

□

12. 求向量场 $\mathbf{v} = (y^2 + z^2)\mathbf{i} + (z^2 + x^2)\mathbf{j} + (x^2 + y^2)\mathbf{k}$ 沿曲线 L 的环量. L 为 $x^2 + y^2 + z^2 = R^2 (z \geq 0)$ 与 $x^2 + y^2 = Rx$ 的交线, 从 x 轴正向看来, L 沿反时针方向.

解:

$$\begin{aligned} x^2 + y^2 = Rx &\Leftrightarrow \left(x - \frac{R}{2}\right)^2 + y^2 = \frac{R^2}{4} \\ x &= \frac{R}{2} + \frac{R}{2} \cos \theta, \quad y = \frac{R}{2} \sin \theta, \quad \therefore z = R \sin \frac{\theta}{2} \\ I &= \oint \vec{v} \cdot d\vec{l} = \oiint \nabla \times \vec{v} \cdot \vec{n} dS = \frac{2}{R} \iint \left(\frac{y-z}{x}, \frac{z-x}{y}, \frac{x-y}{z} \right) ds = 0 \end{aligned}$$

11.6 习题 其他形式曲线曲面积分

1. 利用散度的积分表示, 推导出在柱坐标系下的散度.
2. 利用梯度的积分表示, 推导出在球坐标系下的梯度.

解:

$$\begin{aligned}
 1. \quad \nabla \cdot \vec{v} &= \lim_{\Delta r, \Delta \theta, \Delta z \rightarrow 0} \left(\frac{1}{\Delta r \Delta \theta \Delta z} \oint_S \vec{v} \cdot d\vec{s} \right) \\
 &= \frac{1}{r} \frac{\partial}{\partial r} (rv_r) + \frac{1}{r} \frac{\partial}{\partial \theta} (v_\theta) + \frac{\partial}{\partial z} (v_z) \\
 2. \quad \nabla u &= \lim_{V \rightarrow 0} \frac{1}{|V|} \oint_{\partial V} u \mathbf{n} dS \\
 &= \frac{\partial u}{\partial r} \vec{e}_r + \frac{1}{r} \frac{\partial u}{\partial \theta} \vec{e}_\theta + \frac{1}{r \sin \theta} \frac{\partial u}{\partial \varphi} \vec{e}_\varphi
 \end{aligned}$$

3. 设函数 $u(x, y, z)$ 在光滑曲面 S 所围成的闭区域 V 上具有直到二阶的连续偏微商, 而且满足拉普拉斯方程:

$$\Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0$$

试证明: (1) $\oint_S \frac{\partial u}{\partial \mathbf{n}} dS = 0$ (2) $\oint_S u \frac{\partial u}{\partial \mathbf{n}} dS = \iiint_V (\nabla u)^2 dV$, 其中 $\frac{\partial u}{\partial \mathbf{n}}$ 是 u 沿 S 外侧法向量 $\mathbf{n}$ 的方向微商.

证明: (1) 由 Gauss 公式

$$\begin{aligned}
 \oint_S \frac{\partial u}{\partial \mathbf{n}} dS &= \oint_S \left[\frac{\partial u}{\partial x} \cos \langle \mathbf{n}, x \rangle + \frac{\partial u}{\partial y} \cos \langle \mathbf{n}, y \rangle + \frac{\partial u}{\partial z} \cos \langle \mathbf{n}, z \rangle \right] dS \\
 &= \oint_S \frac{\partial u}{\partial x} dydz + \frac{\partial u}{\partial y} dzdx + \frac{\partial u}{\partial z} dxdy \\
 &= \iiint_V \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) dxdydz = \iiint_V \Delta u dxdydz = 0
 \end{aligned}$$

(2) 由 Gauss 公式

$$\begin{aligned}
 \oint_S u \frac{\partial u}{\partial \mathbf{n}} dS &= \oint_S \left[u \frac{\partial u}{\partial x} \cos \langle \mathbf{n}, x \rangle + u \frac{\partial u}{\partial y} \cos \langle \mathbf{n}, y \rangle + u \frac{\partial u}{\partial z} \cos \langle \mathbf{n}, z \rangle \right] dS \\
 &= \oint_S u \frac{\partial u}{\partial x} dydz + u \frac{\partial u}{\partial y} dzdx + u \frac{\partial u}{\partial z} dxdy \\
 &= \iiint_V \left[\frac{\partial}{\partial x} \left(u \frac{\partial u}{\partial x} \right) + \frac{\partial}{\partial y} \left(u \frac{\partial u}{\partial y} \right) + \frac{\partial}{\partial z} \left(u \frac{\partial u}{\partial z} \right) \right] dxdydz \\
 &= \iiint_V \left[\left(\frac{\partial u}{\partial x} \right)^2 + \left(\frac{\partial u}{\partial y} \right)^2 + \left(\frac{\partial u}{\partial z} \right)^2 \right] dxdydz + \iiint_V u \Delta u dxdydz \\
 &= \iiint_V (\nabla u)^2 dV
 \end{aligned}$$

□

11.7 习题 保守场

1. 设平面上有四条路径: L_1 : 折线, 从 $(0,0)$ 到 $(1,0)$ 再到 $(1,1)$; L_2 : 从 $(0,0)$ 沿着抛物线 $y = x^2$ 到 $(1,1)$; L_3 : 从 $(0,0)$ 到 $(1,1)$ 的直线段; L_4 : 折线, 从 $(0,0)$ 到 $(0,1)$ 再到 $(1,1)$. 求下列力场 F 沿上述四条路径所作的功, 并说明它们的值为什么会相等或不等.

(1) $F = -y\mathbf{i} + x\mathbf{j}$; (2) $F = 2xy\mathbf{i} + x^2\mathbf{j}$.

解:

$$W_1 = 1, W_2 = \frac{1}{3}, W_3 = 0, W_4 = -1,$$

$$\nabla \times \mathbf{F} = 1 + 1 = 2 \neq 0$$

$$W_1 = W_2 = W_3 = W_4 = 1,$$

$$\nabla \times \mathbf{F} = 0$$

★ 有旋场沿任意路径做功不一定相等; 而无旋场为保守力场, 沿任意路径做功相等。

2. 求下列曲线积分. (1) $\int_L (2x + y)dx + (x + 4y + 2z)dy + (2y - 6z)dz$, 其中 L 由点 $P_1(a, 0, 0)$ 沿曲线 (2) $\int_{\widehat{AMB}} (x^2 - yz)dx + (y^2 - zx)dy + (z^2 - xy)dz$, 其中 $\widehat{AMB}$ 是柱面螺线 $x = a \cos \varphi, y = a \sin \varphi, z = \frac{h}{2\pi}\varphi$ 上点 $A(a, 0, 0)$ 到 $B(a, 0, h)$ 这一段.

解: (1)

$$I_1 = \int_0^{\frac{\pi}{2}} a(2a \cos \theta + a \sin \theta)d \cos \theta + a^2(\cos \theta + 4 \sin \theta)d \sin \theta$$

$$= a^2 \int_0^{\frac{\pi}{2}} (2 \sin \theta \cos \theta + \cos 2\theta)d\theta = 0$$

$$I_2 = \int_0^9 -(4a - 2z)dz + (2a - 8z)dz = -5a^2$$

$$I = I_1 + I_2 = -5a^2$$

(2) 被积微分是势函数 $\Phi(x, y, z) = \frac{x^3 + y^3 + z^3}{3} - xyz$ 的全微分, 故

$$I = \Phi(a, 0, h) - \Phi(a, 0, 0) = \frac{h^3}{3}.$$

3. 证明下列向量场是有势场, 并求出它们的势函数.

(1) $\mathbf{v} = (2x \cos y - y^2 \sin x) \mathbf{i} + (2y \cos x - x^2 \sin y) \mathbf{j}$; (2) $\mathbf{v} = yz(2x + y + z) \mathbf{i} + xz(2y + z + x) \mathbf{j} + xy(2z + x + y) \mathbf{k}$; (3) $\mathbf{v} = r^2 \mathbf{r}$, ($\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $r = |\mathbf{r}|$)

证明: 可以验证 $\nabla \times \vec{v} = \vec{0}$,

$$(1) \varphi(x, y) = x^2 \cos y + y^2 \cos x + C.$$

$$(2) \varphi(x, y, z) = xyz(x + y + z) + C$$

$$(3) \varphi(x, y, z) = \frac{x^4 + y^4 + z^4}{4} + \frac{x^2 y^2 + y^2 z^2 + z^2 x^2}{2} + C$$

□

4. 当 a 取何值时, 向量场 $\mathbf{F} = (x^2 + 5ay + 3yz) \mathbf{i} + (5x + 3axz - 2) \mathbf{j} + [(a + 2)xy - 4z] \mathbf{k}$ 是有势场, 并求出这时的势函数.

解:

$$\nabla \times \vec{v} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + 5ay + 3yz & 5x + 3axz - 2 & (a + 2)xy - 4z \end{vmatrix} = \vec{0}, \quad a = 1$$

$$\begin{aligned} \varphi(x, y, z) &= \int_{(0,0,0)}^{(x,y,z)} (x^2 + 5y + 3yz) dx + (5x + 3xz - 2) dy + (3xy - 4z) dz \\ &= \int_0^x x^2 dx + \int_0^y (5x - 2) dy + \int_0^z (3xy - 4z) dz \\ &= \frac{x^3}{3} + 5xy - 2y + 3xyz - 2z^2 + C. \end{aligned}$$

5. 求下列全微分的原函数 u :

(1) $du = (3x^2 + 6xy^2) dx + (6x^2y - 4y^3) dy$ (2) $du = (x^2 - 2yz) dx + (y^2 - 2xz) dy + (z^2 - 2xy) dz$.

解:

$$\begin{aligned} (1) \varphi(x, y) &= \int_{(0,0)}^{(x,y)} (6xy^2 + 3x^2) dx + (6x^2y - 4y^3) dy \\ &= \int_0^x 3x^2 dx + \int_0^y (6x^2y - 4y^3) dy \\ &= x^3 + 3x^2y^2 - y^4 + C. \end{aligned}$$

$$\begin{aligned} (2) \varphi(x, y, z) &= \int_{(0,0,0)}^{(x,y,z)} (x^2 - 2yz) dx + (y^2 - 2xz) dy + (z^2 - 2xy) dz \\ &= \int_0^x x^2 dx + \int_0^y y^2 dy + \int_0^z (z^2 - 2xy) dz \\ &= \frac{x^3 + y^3 + z^3}{3} - 2xyz + C \end{aligned}$$

6. 验证下列积分与路径无关, 并求出它们的值.

- (1) $\int_{(0,0)}^{(1,1)} (x - y)(dx - dy)$; (2) $\int_{(1,1)}^{(2,2)} \left(\frac{1}{y} \sin \frac{x}{y} - \frac{y}{x^2} \cos \frac{y}{x} + 1 \right) dx + \left(\frac{1}{x} \cos \frac{y}{x} - \frac{x}{y^2} \sin \frac{x}{y} + \frac{1}{y^2} \right) dy$; (3) $\int_{(1,0)}^{(6,3)} \frac{xdx+ydy}{\sqrt{x^2+y^2}}$ (4) $\int_{(0,0,2)}^{(2,3,-4)} x dx + y^2 dy - z^3 dz$; (5) $\int_{(1,1,1)}^{(2,2,2)} \left(1 - \frac{1}{y} + \frac{y}{z} \right) dx + \left(\frac{x}{z} + \frac{x}{y^2} \right) dy - \frac{xy}{z^2} dz$; (6) $\int_{(x_1, y_1, z_1)}^{(x_2, y_2, z_2)} \frac{x dx + y dy + z dz}{\sqrt{x^2 + y^2 + z^2}}$ 其中 $(x_1, y_1, z_1), (x_2, y_2, z_2)$ 在球面 $x^2 + y^2 + z^2 = a^2$ 上.

解: 可以验证 $\nabla \times \vec{v} = \vec{0}$,

$$I_1 = \int_0^1 0.0 = 0$$

$$\begin{aligned} I_2 &= \int_1^2 \left(\frac{1}{x} \sin 1 - \frac{1}{x} \cos 1 + 1 \right) dx + \left(\frac{1}{x} \cos 1 - \frac{1}{x} \sin 1 + \frac{1}{x^2} \right) dx \\ &= \int_1^2 \left(1 + \frac{1}{x^2} \right) dx = \frac{3}{2} \end{aligned}$$

$$I_3 = \int_{(0,0)}^{(6,3)} - \int_{(0,0)}^{(1,0)} = \int_0^6 \frac{\frac{5}{4}xdx}{\sqrt{x^2 + \frac{x^2}{4}}} - \int_0^1 1dx = 3\sqrt{5} - 1$$

$$I_4 = \int_0^2 xdx + \int_0^3 y^2dy + \int_2^{-4} -z^3dz = 2 + 9 - 60 = -49$$

$$I_5 = \int_1^2 \left(1 - \frac{1}{x} + 1 + 1 + \frac{1}{x} - \frac{x^2}{x^2} \right) dx = \int_1^2 2dx = 2$$

$$I_6 = \int_{(x_1, y_1, z_1)}^{(x_2, y_2, z_2)} \frac{(x, y, z) \cdot (dx, dy, dz)}{\sqrt{x^2 + y^2 + z^2}} = \int_{(x_1, y_1, z_1)}^{(x_2, y_2, z_2)} \nabla \varphi \cdot dr = \int_{(x_1, y_1, z_1)}^{(x_2, y_2, z_2)} d\varphi = 0$$

7. 设 $f(u)$ 是个连续的函数, 但不一定可微, L 是分段光滑的任意闭曲线, 证明:

- (1) $\oint_L f(x^2 + y^2)(x dx + y dy) = 0$; (2) $\oint_L f(\sqrt{x^2 + y^2 + z^2})(x dx + y dy + z dz) = 0$.

解: (1) 令 $u = x^2 + y^2$ 及 $F(u) = \int_0^u f(t) dt$, 则

$$f(x^2 + y^2)(x dx + y dy) = \frac{1}{2}f(u) du = \frac{1}{2}dF(u),$$

故其沿任意闭曲线的积分为零。

(2) 令 $r = \sqrt{x^2 + y^2 + z^2}$ 及 $G(r) = \int_0^r tf(t) dt$. 因为 $x dx + y dy + z dz = r dr$, 所以

$$f(r)(x dx + y dy + z dz) = f(r)r dr = dG(r),$$

其沿任意闭曲线的积分也为零。 □

8. 稳恒电流通过无穷长的直导线 (作 Oz 轴) 所产生的磁场为 $\mathbf{B} = \frac{2I}{x^2 + y^2}(-y\mathbf{i} + x\mathbf{j})$ ($x^2 + y^2 \neq 0$), 试讨论 $\mathbf{B}$ 沿 Oxy 平面上任意光滑闭曲线的环量 Γ .

解: 在 $x^2 + y^2 \neq 0$ 处有 $\nabla \times \mathbf{B} = \mathbf{0}$, 但原点是奇点, 不能对包围原点的区域直接使用 Green 公式。写成极坐标形式,

$$\mathbf{B} \cdot d\mathbf{r} = 2I d\theta, \quad \oint_L \mathbf{B} \cdot d\mathbf{r} = 4\pi I \text{Ind}(L, 0),$$

其中 $\text{Ind}(L, 0)$ 是 L 绕原点的有向环绕数。因此不包围原点时 $\Gamma = 0$; 正向绕原点一次时 $\Gamma = 4\pi I$ 。

9. 试求函数 $f(x)$, 使曲线积分 $\int_L (f'(x) + 6f(x) + e^{-2x})y \, dx + f'(x)dy$ 与积分的路径无关。

解:

$$\begin{aligned}\therefore \frac{\partial Q}{\partial x} &= \frac{\partial P}{\partial y} \Rightarrow f''(x) = f'(x) + 6f(x) + e^{-2x} \\ &\Rightarrow f''(x) - f'(x) - 6f(x) = e^{-2x} = f_0(x)\end{aligned}$$

因为特征方程两个根为: $\lambda_1 = 3, \lambda_2 = -2$, 所以齐通解为 $\bar{f}(x) = C_1 e^{3x} + C_2 e^{-2x} = C_1 f_1 + C_2 f_2$

$$\text{计算 Wronski 行列式: } w(x) = \begin{vmatrix} f_1 & f_2 \\ f_1' & f_2' \end{vmatrix} = f_1 f_2' - f_2 f_1' = -5e^x$$

$$\text{所以非齐特解为 } f^*(x) = \int_{x_0}^x \frac{f_1(t)f_2(x) - f_2(t)f_1(x)}{w(t)} f_0(t) dt = \int_{x_0}^x \frac{e^{t-2x} - e^{-4t+3x}}{-5e^t} dt = -\frac{xe^{-2x}}{5}$$

$$f(x) = \bar{f}(x) + f^*(x) = C_1 e^{3x} + C_2 e^{-2x} - \frac{xe^{-2x}}{5}$$

10. 已知 $\alpha(0) = 0, \alpha'(0) = 2, \beta(0) = 2$ 。

(1) 求 $\alpha(x), \beta(x)$ 使线积分 $\int_L P \, dx + Q \, dy$ 与路线无关, 其中 $P(x, y) = (2x\alpha'(x) + \beta(x))y^2 - 2y\beta(x)\tan 2x, Q(x, y) = (\alpha'(x) + 4x\alpha(x))y + \beta(x)$ (2) 求 $\int_{(0,0)}^{(0,2)} P \, dx + Q \, dy$ 。

解:

$$(1) \text{ 由 } \frac{\partial Q}{\partial x} = \frac{\partial P}{\partial y} \Rightarrow y(\alpha''(x) + 4\alpha(x) - 2\beta(x)) + \beta'(x) + 2\beta(x)\tan 2x = 0$$

$$\therefore \begin{cases} \alpha''(x) + 4\alpha(x) = 2\beta(x) \\ \beta'(x) + 2\beta(x)\tan 2x = 0 \end{cases} \Rightarrow \begin{cases} \beta(x) = 2\cos 2x \\ \alpha(x) = x\sin 2x + \sin 2x \end{cases}$$

$$\therefore P(x, y) = y^2 (2x\sin 2x + 4x^2\cos 2x + 4x\cos 2x + 2\cos 2x) - 4y\sin 2x$$

$$Q(x, y) = y((2x+1)^2\sin 2x + 2(x+1)\cos 2x) + 2\cos 2x$$

$$(2) \quad I = \int_0^2 (2y+2)dy = (y^2+2y)|_0^2 = 8$$

11. 设函数 $Q(x, y)$ 在 Oxy 平面上具有一阶连续偏导数, 曲线积分 $\int_L 2xy \, dx + Q(x, y)dy$ 与路径无关, 并且对任意 t 恒有

$$\int_{(0,0)}^{(t,1)} 2xy \, dx + Q(x, y)dy = \int_{(0,0)}^{(1,t)} 2xy \, dx + Q(x, y)dy, \text{ 求 } Q(x, y)$$

解:

$$\begin{aligned}
 &\text{通过 } \frac{\partial(2xy)}{\partial y} = \frac{\partial Q}{\partial x}, \quad \therefore 2x = \frac{\partial Q}{\partial x}, \quad Q(x, y) = x^2 + g(y) \\
 &\int_{(0,0)}^{(t,1)} Pdx + Qdy = \int_0^t 0 \cdot dx + \int_0^1 (t^2 + g(y)) dy = t^2 + \int_0^1 g(y) dy \\
 &\int_{(0,0)}^{(1,t)} Pdx + Qdy = \int_0^1 0 \cdot dx + \int_0^t (1^2 + g(y)) dy = t + \int_0^t g(y) dy \\
 &\text{两边对 } t \text{ 求导得 } 2t = 1 + g(t), \quad g(t) = 2t - 1, \\
 &\therefore Q(x, y) = x^2 + 2y - 1.
 \end{aligned}$$

12. 求解微分方程: (1) $(xy^2 + 2y - 2y \cos x - y \sin x) dx + (x^2y + 2x + \cos x - 2 \sin x) dy = 0$; (2) $2xy dx + (y^2 - x^2) dy = 0$.

解:

$$\begin{aligned}
 (1) \varphi(x, y) &= \int_{(0,0)}^{(x,y)} Pdx + Qdy = \int_0^x 0 dx + \int_0^y (x^2y + 2x + \cos x - 2 \sin x) dy \\
 &= \frac{x^2y^2}{2} + 2xy + y \cos x - 2y \sin x + C.
 \end{aligned}$$

(2) $2xy dx + (y^2 - x^2) dy = 0$ 不是全微分方程。

在 $y \neq 0$ 时乘以积分因子 y^{-2} , 得到

$$d\left(\frac{x^2 + y^2}{y}\right) = 0, \quad \text{quad} \frac{x^2 + y^2}{y} = C,$$

13. 设 $f(x)$ 具有二阶连续导数, $f(0) = 0, f'(0) = 2$, 且 $(e^x \sin y + x^2y + f(x)y) dx + (f'(x) + e^x \cos y + 2x) dy = 0$ 为全微分方程. 求 $f(x)$ 及此全微分方程的通解.

解:

$$\begin{aligned}
 P(x, y) &= e^x \sin y + x^2y + f(x)y \\
 Q(x, y) &= f'(x) + e^x \cos y + 2x, \quad \frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}, \\
 &\Rightarrow f''(x) + e^x \cos y + 2 = e^x \cos y + x^2 + f(x) \\
 &\therefore f''(x) - f(x) = x^2 - 2, \quad f'(0) = 2, \quad f(0) = 0 \\
 f(x) &= c_1 e^x + c_2 e^{-x} - x^2 \quad (c_1 = 1, c_2 = -1) = e^x - e^{-x} - x^2 \\
 &\Rightarrow (e^x \sin y + e^x y - e^{-x} y) dx + (e^x + e^{-x} + e^x \cos y) dy = 0 \\
 f(x, y) &= \int_0^x (e^x \sin y + e^x y - e^{-x} y) dx + g(y), \\
 F'_y(x, y) &= 0 \Rightarrow g'(y) = 0, \\
 \therefore \text{通解: } &e^x \sin y + e^x y + e^{-x} y = C.
 \end{aligned}$$

14. 确定常数 λ , 使在右半平面 $x > 0$ 上的向量场

$$\mathbf{v} = 2xy(x^4 + y^2)^\lambda \mathbf{i} - x^2(x^4 + y^2)^\lambda \mathbf{j}$$

为某二元函数 $u(x, y)$ 的梯度, 并求 $u(x, y)$.

解:

$$\begin{aligned} \mathbf{v} = \nabla u \quad \therefore \nabla \times \mathbf{v} &= \nabla \times \nabla u = \mathbf{0}, \mathbf{v} = P\mathbf{i} + Q\mathbf{j}, \\ \therefore \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} &= (-4 - 4\lambda)x(x^4 + y^2)^\lambda = 0 \quad \therefore \lambda = -1, \\ \mathbf{v} &= \frac{2xy}{x^4 + y^2} \mathbf{i} - \frac{x^2}{x^4 + y^2} \mathbf{j}, \quad u = -\arctan \frac{y}{x^2} + C. \end{aligned}$$

15. 给出二维情况下梯度和 Laplace 算子在极坐标系下的表示.

$$\nabla = \hat{e}_x \frac{\partial}{\partial x} + \hat{e}_y \frac{\partial}{\partial y}$$

解:

$$\begin{aligned} \hat{e}_x &= \cos \theta \hat{e}_r - \sin \theta \hat{e}_\theta, \quad \hat{e}_y = \sin \theta \hat{e}_r + \cos \theta \hat{e}_\theta \\ \frac{\partial}{\partial x} &= \frac{\partial r}{\partial x} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial x} \frac{\partial}{\partial \theta}, \quad \frac{\partial}{\partial y} = \frac{\partial r}{\partial y} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial y} \frac{\partial}{\partial \theta} \\ r &= \sqrt{x^2 + y^2}, \theta = \arctan \frac{y}{x} \\ \therefore \frac{\partial r}{\partial x} &= \frac{x}{\sqrt{x^2 + y^2}} = \cos \theta, \frac{\partial r}{\partial y} = \frac{y}{\sqrt{x^2 + y^2}} = \sin \theta \\ \frac{\partial \theta}{\partial x} &= -\frac{y}{x^2 + y^2} = -\frac{\sin \theta}{r}, \frac{\partial \theta}{\partial y} = \frac{x}{x^2 + y^2} = \frac{\cos \theta}{r} \end{aligned}$$

$$\begin{aligned} \nabla &= \hat{e}_x \frac{\partial}{\partial x} + \hat{e}_y \frac{\partial}{\partial y} \\ &= (\cos \theta \hat{e}_r - \sin \theta \hat{e}_\theta) \left(\frac{\partial r}{\partial x} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial x} \frac{\partial}{\partial \theta} \right) + (\sin \theta \hat{e}_r + \cos \theta \hat{e}_\theta) \left(\frac{\partial r}{\partial y} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial y} \frac{\partial}{\partial \theta} \right) \\ &= \hat{e}_r \frac{\partial}{\partial r} + \hat{e}_\theta \frac{1}{r} \frac{\partial}{\partial \theta}, (\text{极坐标表示}) \end{aligned}$$

$$\begin{aligned}
\Delta &= \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} = \left(\cos \theta \frac{\partial}{\partial r} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \right)^2 + \left(\sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \right)^2 \\
&= \cos^2 \theta \frac{\partial^2}{\partial r^2} - \cos \theta \frac{\partial}{\partial r} \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \cos \theta \frac{\partial}{\partial r} + \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \\
&\quad + \sin^2 \theta \frac{\partial^2}{\partial r^2} + \sin \theta \frac{\partial}{\partial r} \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \\
&= \frac{\partial^2}{\partial r^2} + 2 \cos \theta \frac{\sin \theta}{r^2} \frac{\partial}{\partial \theta} - 2 \cos \theta \frac{\sin \theta}{r} \frac{\partial^2}{\partial r \partial \theta} + \frac{\sin^2 \theta}{r} \frac{\partial}{\partial r} + \frac{\sin^2 \theta}{r^2} \frac{\partial^2}{\partial \theta^2} \\
&\quad - 2 \cos \theta \frac{\sin \theta}{r^2} \frac{\partial}{\partial \theta} + 2 \cos \theta \frac{\sin \theta}{r} \frac{\partial^2}{\partial r \partial \theta} + \frac{\cos^2 \theta}{r} \frac{\partial}{\partial r} + \frac{\cos^2 \theta}{r^2} \frac{\partial^2}{\partial \theta^2} \\
&= \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \theta^2}.
\end{aligned}$$

Laplace算子:

$$\Delta u = 0 \iff \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0$$

16. 利用 Laplace 算子在极坐标和球坐标下的表示, 分别验证:

(1) $u(x, y) = \ln \sqrt{x^2 + y^2}$; (2) $u(x, y, z) = \frac{1}{\sqrt{x^2 + y^2 + z^2}}$ 是 Laplace 方程 $\Delta u = 0$ 的解.

解: (1) 极坐标下, $u = \ln r$, $\frac{\partial u}{\partial r} = \frac{1}{r}$, $\frac{\partial^2 u}{\partial r^2} = -\frac{1}{r^2}$, $\frac{\partial^2 u}{\partial \theta^2} = 0$,

$$\therefore \Delta u = \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0$$

(2) 球坐标下, $u = \frac{1}{r}$, $\frac{\partial u}{\partial r} = -\frac{1}{r^2}$, $r^2 \frac{\partial u}{\partial r} = -1$, $\frac{\partial u}{\partial \theta} = \frac{\partial u}{\partial \varphi} = 0$,

$$\therefore \Delta u = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial u}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial u}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 u}{\partial \varphi^2} = 0. \quad \square$$

11.8 第 11 章综合习题

1. 求第一型曲线积分 $I = \int_L z \, ds$,

其中 L 是曲面 $x^2 + y^2 = z^2$ 与 $y^2 = ax (a > 0)$ 交线上从点 $(0,0,0)$ 到 $(a, a, a\sqrt{2})$ 的弧段.

解 取 y 为参变量, 因此

$$x(y) = \frac{y^2}{a}, y = y, z = \frac{y}{a} \sqrt{y^2 + a^2}, 0 \leq y \leq a.$$

因此, 弧长的微分为

$$\begin{aligned} ds &= \sqrt{\left(\frac{2y}{a}\right)^2 + 1 + \left(\frac{2y^2 + a^2}{a\sqrt{y^2 + a^2}}\right)^2} dy = \sqrt{\frac{8y^4 + 9a^2y^2 + 2a^4}{a^2(y^2 + a^2)}} dy \\ \therefore I &= \int_L z \, ds = \int_0^a \frac{y}{a} \sqrt{y^2 + a^2} \sqrt{\frac{8y^4 + 9a^2y^2 + 2a^4}{a^2(y^2 + a^2)}} dy \\ &= \frac{\sqrt{8}}{a^2} \int_0^a y \sqrt{y^4 + \frac{9}{8}a^2y^2 + \frac{1}{4}a^4} dy. \end{aligned}$$

为了计算上述积分, 作变换

$$\begin{aligned} u &= y^2 + \frac{9a^2}{16}, b^2 = \frac{17a^4}{16^2} \\ \therefore I &= \frac{\sqrt{2}}{a^2} \int_{\frac{9a^2}{16}}^{\frac{25a^2}{16}} \sqrt{u^2 - b^2} \, du \end{aligned}$$

函数 $\sqrt{u^2 - b^2}$ 的原函数可以按如下计算. 令

$$u = b \cosh t, \sqrt{u^2 - b^2} = b \sinh t, \quad du = b \sinh t \, dt$$

所以

$$\int \sqrt{u^2 - b^2} \, du = b^2 \int \sinh^2 t \, dt = b^2 \int \frac{1}{2} (\cosh 2t - 1) dt = \frac{b^2}{4} \sinh 2t - \frac{b^2}{2} t.$$

将

$$t = \cosh^{-1} \frac{u}{b}$$

代入得到

$$\begin{aligned} \int \sqrt{u^2 - b^2} \, du &= \frac{b^2}{4} \sinh \left(2 \cosh^{-1} \frac{u}{b} \right) - \frac{b^2}{2} \cosh^{-1} \frac{u}{b} \\ &= \frac{1}{2} \left(u \sqrt{u^2 - b^2} - b^2 \ln \left| \sqrt{u^2 - b^2} + u \right| \right) + C \end{aligned}$$

$$\therefore I = \frac{\sqrt{2}}{2a^2} \left(u \sqrt{u^2 - b^2} - b^2 \ln \left(\sqrt{u^2 - b^2} + u \right) \right) \Big|_{\frac{9a^2}{16}}^{\frac{25a^2}{16}} = \frac{\sqrt{2}a^2}{512} \left(100\sqrt{38} - 72 - 17 \ln \frac{25 + 4\sqrt{38}}{17} \right)$$

另法:

$$\begin{aligned}
 x &= x, \quad y = \sqrt{ax}, \quad z = \sqrt{x^2 + ax} \\
 ds &= \sqrt{x'_x + y'_x + z'_x} dx = \sqrt{1 + \left(\frac{\sqrt{a}}{2\sqrt{x}}\right)^2 + \left(\frac{2x+a}{2\sqrt{x^2+ax}}\right)^2} dx \\
 &= \frac{\sqrt{8x^2+9ax+2a^2}}{2\sqrt{x^2+ax}} dx = \frac{\sqrt{8}\sqrt{\left(x+\frac{9}{16}a\right)^2 - \left(\frac{\sqrt{17}}{16}a\right)^2}}{2\sqrt{x^2+ax}} dx \\
 I &= \int_L z ds = \int_0^a \sqrt{2} \sqrt{\left(x+\frac{9}{16}a\right)^2 - \left(\frac{\sqrt{17}}{16}a\right)^2} dx \\
 &= \int_{\frac{9a}{16}}^{\frac{25a}{16}} \sqrt{2} \sqrt{u^2 - b^2} du \quad b = \frac{\sqrt{17}a}{16} \\
 I_0 &= \int \sqrt{u^2 - b^2} du = \frac{1}{2} \left(u\sqrt{u^2 - b^2} - b^2 \ln |u + \sqrt{u^2 - b^2}| \right) + C, \\
 I &= \frac{\sqrt{2}}{2} \left(u\sqrt{u^2 - b^2} - b^2 \ln |\sqrt{u^2 - b^2} + u| \right) \Big|_{\frac{9a}{16}}^{\frac{25a}{16}} = \frac{\sqrt{2}a^2}{512} \left(100\sqrt{38} - 72 - 17 \ln \frac{25+4\sqrt{38}}{17} \right)
 \end{aligned}$$

2、设 $a, b, c > 0$, 求曲线

$$L: \left(\frac{x}{a}\right)^{2n+1} + \left(\frac{y}{b}\right)^{2n+1} = c \left(\frac{x}{a}\right)^n \left(\frac{y}{b}\right)^n$$

所围成的区域 D 的面积.

注: 该题中若 $n = 1$, 则曲线就是著名的 Descartes 叶形线.

解 由 Green 公式的推论知

$$\mu(D) = \frac{1}{2} \oint (-y dx + x dy)$$

为了计算积分, 令 $y = \frac{b}{a}xt$, 得

$$\begin{aligned}
 x &= x(t) = ac \frac{t^n}{1+t^{2n+1}}, \quad y = y(t) = bc \frac{t^{n+1}}{1+t^{2n+1}}, \quad 0 \leq t < +\infty. \\
 \therefore x'(t) &= ac \frac{nt^{n-1} - (n+1)t^{3n}}{(1+t^{2n+1})^2}, \quad y'(t) = bc \frac{(n+1)t^n - nt^{3n+1}}{(1+t^{2n+1})^2}, \\
 \mu(D) &= \frac{1}{2} \oint (-y dx + x dy) = \frac{1}{2} \int_0^{+\infty} (-y(t)x'(t) + x(t)y'(t)) dt \\
 &= \frac{1}{2} \int_0^{+\infty} \frac{abc^2 t^{2n}}{(1+t^{2n+1})^2} dt = \frac{abc^2}{2(2n+1)}
 \end{aligned}$$

3. 求平面上下列两个椭圆

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \quad \frac{x^2}{b^2} + \frac{y^2}{a^2} = 1 (a > b)$$

内部公共区域的面积.

解 由对称性, 只要计算在第一象限的公共区域 D 的面积即可. 为此, 先求两个椭圆在第一象限的交点坐标 $P(x_0, y_0)$: 两个分程相减, 得 $x_0 = y_0$. 因此

$$x_0^2 \left(\frac{1}{a^2} + \frac{1}{b^2} \right) = 1$$

$$x_0 = y_0 = \frac{ab}{\sqrt{a^2 + b^2}}.$$

因此, 在第一象限的公共区域 D 是由椭圆 C_1 上从 $P(x_0, y_0)$ 到 y 轴上点 $A(0, b)$ 的弧段 L_{PA} 和 C_2 上从 x 轴上点 $B(b, 0)$ 到 $P(x_0, y_0)$ 的弧段 L_{BP} 以及 x 轴上线段 $\overline{OB}$ 和 y 轴上线段 $\overline{AO}$ 围成的. 方向逆时针. 对于 L_{PA} , 取 $x = a \cos \theta, y = b \sin \theta$. 在交点 $P(x_0, y_0)$ 处, 有 $x_0 = y_0$, 对应的 θ_0 满足

$$a \cos \theta_0 = b \sin \theta_0, \therefore \tan \theta_0 = \frac{a}{b}, \theta_0 = \tan^{-1} \left(\frac{a}{b} \right).$$

在 $A(0, b)$, 对应的 θ_1 满足

$$a \cos \theta_1 = 0 \therefore \theta_1 = \frac{\pi}{2}$$

因此 L_{PA} 的参数方程表示为

$$x = a \cos \theta, y = b \sin \theta, \tan^{-1} \left(\frac{a}{b} \right) \leq \theta \leq \frac{\pi}{2}.$$

同理, 对于 L_{BP} , 取 $x = b \cos \theta, y = a \sin \theta$. 在交点 $P(x_0, y_0)$ 处, 有 $x_0 = y_0$, 对应的 θ_2 满足

$$b \cos \theta_2 = a \sin \theta_2, \therefore \tan \theta_2 = \frac{b}{a}, \theta_2 = \tan^{-1} \left(\frac{b}{a} \right).$$

在 $B(b, 0)$, 对应的 θ_3 满足

$$a \sin \theta_3 = 0, \therefore \theta_3 = 0$$

因此 L_{BP} 的参数方程表示为

$$x = b \cos \theta, y = a \sin \theta, 0 \leq \theta \leq \tan^{-1} \left(\frac{b}{a} \right).$$

所以由 Green 公式, 面积为

$$S(D) = \frac{1}{2} \oint_{\partial D} (-y \, dx + x \, dy).$$

分段积分, 并注意到在直线 $\overline{OB}$ 上, $y = 0, \, dx = 0$; 在 $\overline{AO}$ 上 $x = 0, \, dy = 0$. 所以

$$\begin{aligned} S(D) &= \frac{1}{2} \oint_{L_{PA}} (-y \, dx + x \, dy) + \frac{1}{2} \oint_{L_{BP}} (-y \, dx + x \, dy) \\ &= \frac{1}{2} \int_{\tan^{-1}(\frac{a}{b})}^{\frac{\pi}{2}} ab (\sin^2 \theta + \cos^2 \theta) d\theta + \frac{1}{2} \int_0^{\tan^{-1}(\frac{b}{a})} ab (\cos^2 \theta + \sin^2 \theta) d\theta \\ &= \frac{1}{2} ab \tan^{-1} \left(\frac{b}{a} \right) + \frac{1}{2} ab \left(\frac{\pi}{2} - \tan^{-1} \left(\frac{a}{b} \right) \right) = ab \tan^{-1} \left(\frac{b}{a} \right) \end{aligned}$$

总面积为

$$4ab \tan^{-1} \left(\frac{b}{a} \right)$$

4. (Poisson 公式) 设 $S: x^2 + y^2 + z^2 = 1$, $f(t)$ 是 $\mathbb{R}$ 上的连续函数, 求证:

$$\iint_S f(ax + by + cz) dS = 2\pi \int_{-1}^1 f(kt) dt$$

$$\text{其中 } k = \sqrt{a^2 + b^2 + c^2}.$$

证明 令 $\vec{n} = \frac{1}{k}(a\vec{i} + b\vec{j} + c\vec{k})$, 那么球面 S 是单位圆以 $\vec{n}$ 为旋转轴的旋转曲面, 设 $P(x, y, z)$ 为球面上一点, 则 $\vec{r} = \overrightarrow{OP}$ 在 $\vec{n}$ 的投影为 $t = \vec{n} \cdot \vec{r}$, 绕 $\vec{n}$ 的旋转半径为

$$\rho = \sqrt{1 - t^2}, \quad d\rho = \frac{-t dt}{\sqrt{1 - t^2}}$$

$$\therefore f(ax + by + cz) = f(kt)$$

只与 $t = \sqrt{1 - \rho^2}$ 有关, 类似旋转曲面的面积元的计算, 面积元为

$$dS = \pi(\rho + (\rho + d\rho))ds = 2\pi\rho \frac{d\rho}{dt} dt = 2\pi dt$$

$$\therefore \iint_S f(ax + by + cz) dS = \iint_S f(kt) dS = 2\pi \int_{-1}^1 f(kt) dt.$$

□

5. 设 $S(t)$ 是平面 $x + y + z = t$ 被球面 $x^2 + y^2 + z^2 = 1$ 截下的部分, 且

$$F(x, y, z) = 1 - (x^2 + y^2 + z^2)$$

求证: 当 $|t| \leq \sqrt{3}$ 时, 有

$$\iint_{S(t)} F(x, y, z) dS = \frac{\pi}{18} (3 - t^2)^2.$$

证明 证明的过程实际上是一个计算的过程. 首先注意到平面 Π 的一个单位法向量是 $\vec{n} = \frac{1}{\sqrt{3}}(1, 1, 1)$, 不难计算原点到 Π 的距离为 $\frac{|t|}{\sqrt{3}}$, 所以当 $|t| > \sqrt{3}$ 时, 和球面 B 没有交. 其次注意到当 $|t| \leq \sqrt{3}$ 时, $S(t)$ 是一个圆盘, 圆盘的圆心为 $(\frac{t}{3}, \frac{t}{3}, \frac{t}{3})$, 半径为

$$r_0 = \sqrt{1 - \frac{t^2}{3}}$$

设 $S(t)$ 上任意一点 (x, y, z) 到 $S(t)$ 的圆心的距离为 r :

$$\begin{aligned} \left(x - \frac{t}{3}\right)^2 + \left(y - \frac{t}{3}\right)^2 + \left(z - \frac{t}{3}\right)^2 &= r^2, \\ \therefore x^2 + y^2 + z^2 &= \frac{t^2}{3} + r^2 \end{aligned}$$

$S(t)$ 上面积元在极坐标下为

$$dS = r dr d\theta, 0 \leq r \leq r_0, 0 \leq \theta \leq 2\pi$$

因此

$$\begin{aligned}\iint_{S(t)} F(x, y, z) dS &= \iint_{S(t)} \left(1 - \left(\frac{t^2}{3} + r^2\right)\right) r \, dr \, d\theta \\ &= \int_0^{2\pi} d\theta \int_0^{\sqrt{1-\frac{t^2}{3}}} \left(1 - \left(\frac{t^2}{3} + r^2\right)\right) r \, dr = \frac{\pi}{18} (3 - t^2)^2.\end{aligned}$$

□

6. 设 $f(t)$ 在 $|t| \leq \sqrt{a^2 + b^2 + c^2}$ 上连续. 证明:

$$\iiint_{x^2+y^2+z^2 \leq 1} f\left(\frac{ax+by+cz}{\sqrt{x^2+y^2+z^2}}\right) dx \, dy \, dz = \frac{2}{3}\pi \int_{-1}^1 f\left(\sqrt{a^2+b^2+c^2}t\right) dt$$

证明 令

$$x = r \sin \theta \cos \varphi, y = r \sin \theta \sin \varphi, z = r \cos \theta,$$

其中 $0 \leq r \leq 1, 0 \leq \theta \leq \pi, 0 \leq \varphi \leq 2\pi$. 则

$$\begin{aligned}& \iiint_{x^2+y^2+z^2 \leq 1} f\left(\frac{ax+by+cz}{\sqrt{x^2+y^2+z^2}}\right) dx \, dy \, dz \\ &= \int_0^1 dr \int_0^\pi d\theta \int_0^{2\pi} d\varphi f(a \sin \theta \cos \varphi + b \sin \theta \sin \varphi + c \cos \theta) r^2 \sin \theta \\ &= \int_0^1 r^2 dr \int_0^\pi d\theta \int_0^{2\pi} d\varphi f(a \sin \theta \cos \varphi + b \sin \theta \sin \varphi + c \cos \theta) \sin \theta \\ &= \frac{1}{3} \int_0^\pi d\theta \int_0^{2\pi} d\varphi f(a \sin \theta \cos \varphi + b \sin \theta \sin \varphi + c \cos \theta) \sin \theta \\ &= \frac{1}{3} \iint_{x^2+y^2+z^2=1} f(ax+by+cz) dS \\ &= \frac{2}{3}\pi \int_{-1}^1 f\left(t\sqrt{a^2+b^2+c^2}\right) dt\end{aligned}$$

上式中最后一步利用了第 4 题中的 Poisson 公式.

□

7. 设 D 是平面上光滑曲线 L 围成的区域, $f(x, y)$ 在 $\bar{D}$ 上有二阶连续偏导数且满足 Laplace 方程

$$\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$$

求证: 当 $f(x, y)$ 在 L 上恒为零时, 它在 D 上也恒为零.

本题的含义是下列微分方程的边值问题:

$$\begin{cases} \Delta f = 0 & (x, y) \in D \\ f|_{\partial D} = 0 \end{cases}$$

只有零解.

证明 类似习题 11.3 第 7 题 (3) 中的计算, 有

$$\oint_{\partial D} f \frac{\partial f}{\partial \bar{n}} ds = \iint_D \left[f \Delta f + \left(\frac{\partial f}{\partial x} \right)^2 + \left(\frac{\partial f}{\partial y} \right)^2 \right] dx dy$$

因为 $f|_{\partial D} = 0$, 所以上式左边曲线积分为零. 再由 $\Delta f = 0$, 得

$$\iint_D \left[\left(\frac{\partial f}{\partial x} \right)^2 + \left(\frac{\partial f}{\partial y} \right)^2 \right] dx dy = 0$$

因为 f 有连续的二阶偏导数, 所以

$$\frac{\partial f}{\partial x} = \frac{\partial f}{\partial y} = 0,$$

即 f 是 D 上常值函数, 并且在边界上取值为零, 因此 $f(x, y) = 0$ 在 D 上成立. $\square$

8. 设 $f(x, y)$ 在 $\bar{B}(P_0, R)$ 上有二阶连续偏导数且满足 Laplace 方程 $\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$. 求证: 对 $0 \leq r \leq R$, 有 $f(P_0) = \frac{1}{2\pi r} \int_L f(x, y) ds$, 其中 $P_0 = (x_0, y_0)$, L 是以 P_0 为圆心 r 为半径的圆.

证明 令

$$g(r) = \frac{1}{2\pi r} \int_{\partial B_r(P_0)} f(x, y) ds.$$

取 $\partial B_r(P_0)$ 的参数方程为

$$x = x_0 + r \cos \varphi, y = y_0 + r \sin \varphi \quad 0 \leq \varphi \leq 2\pi.$$

所以

$$\begin{aligned} g(r) &= \frac{1}{2\pi} \int_0^{2\pi} f(x_0 + r \cos \varphi, y_0 + r \sin \varphi) d\varphi \\ &= f(P_0) + \frac{1}{2\pi} \int_0^{2\pi} \int_0^r \left(\cos \varphi \frac{\partial f}{\partial x}(x_0 + t \cos \varphi, y_0 + t \sin \varphi) + \sin \varphi \frac{\partial f}{\partial y}(x_0 + t \cos \varphi, y_0 + t \sin \varphi) \right) dt d\varphi \\ &= f(P_0) + \frac{1}{2\pi} \int_0^r dt \int_0^{2\pi} \left(\cos \varphi \frac{\partial f}{\partial x} + \sin \varphi \frac{\partial f}{\partial y} \right) d\varphi \end{aligned}$$

这是一个对 r 的变上限积分, 因此

$$\begin{aligned} g'(r) &= \frac{1}{2\pi} \int_0^{2\pi} \left(\cos \varphi \frac{\partial f}{\partial x} + \sin \varphi \frac{\partial f}{\partial y} \right) d\varphi = \frac{1}{2\pi r} \int_{\partial B_r(P_0)} -\frac{\partial f}{\partial y} dx + \frac{\partial f}{\partial x} dy \\ &= \frac{1}{2\pi r} \iint_{B_r(P_0)} \left(\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} \right) dx dy = 0 \end{aligned}$$

(注: 也可以在 $g(r)$ 表达式中直接对 r 求导, 得到 $g'(r)$.) $g'(r) = 0$ 说明 $g(r)$ 为常数. 所以

$$g(r) = g(0) = \frac{1}{2\pi} \int_0^{2\pi} f(x_0, y_0) d\varphi = f(P_0).$$

$\square$

9. 设 D 是平面上光滑曲线 L 围成的区域, $f(x, y)$ 在 $\bar{D}$ 上有二阶连续偏导数且满足 Laplace 方程

$$\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$$

求证: 若 $f(x, y)$ 不是常数, 则它在 $\bar{D}$ 上的最大值和最小值只能在 D 的边界 $L = \partial D$ 上取到.

证明 假设 $f(x, y)$ 在 D 的内部一点 $P_0(x_0, y_0)$ 取到最大值. 因为 P_0 是内点, 所以存在 $r > 0$, 使得 $B_r(P_0) \subset D$. 在 $B_r(P_0)$ 上, 由第 8 题结果, 有

$$\begin{aligned} f(P_0) &= \frac{1}{2\pi r} \int_{\partial B_r(P_0)} f(x, y) ds \\ \therefore \frac{1}{2\pi r} \int_{\partial B_r(P_0)} [f(x_0, y_0) - f(x, y)] ds &= 0 \\ \therefore \int_0^{2\pi} [f(x_0, y_0) - f(x_0 + r \cos \varphi, y_0 + r \sin \varphi)] d\varphi &= 0 \end{aligned}$$

这里取 $\partial B_r(P_0)$ 的参数方程为

$$x = x_0 + r \cos \varphi, y = y_0 + r \sin \varphi \quad 0 \leq \varphi \leq 2\pi$$

由于 $f(x_0, y_0)$ 是最大值, 上述积分中被积函数为非负连续, 因此积分为零推出被积函数恒为零, 即

$$f(x_0, y_0) - f(x_0 + r \cos \varphi, y_0 + r \sin \varphi) = 0, 0 \leq \varphi \leq 2\pi.$$

或

$$[f(x_0, y_0) - f(x, y)]|_{\partial B_r(P_0)} = 0.$$

根据第 7 题结果, 推出

$$f(x, y) = f(x_0, y_0), \quad (x, y) \in B_r(P_0).$$

其次在 D 的内部任意一点 $P(x, y) \in D^\circ$, 用折线连接 P_0 和 P 点, 并可用有限个圆域 $B_{r_0}(P_0)$, $B_{r_1}(P_1), \dots, B_{r_n}(P_n)$ 覆盖该折线, 逐步递推得 $f(x_0, y_0) = f(x, y)$, 也就是 $f(x, y)$ 在 D 的内部恒为常数 $f(x_0, y_0)$, 再利用函数的连续性得 f 在 $\bar{D}$ 上恒为常数:

$$f(x, y)|_{\bar{D}} = f(x_0, y_0).$$

这与 f 不是常值函数的条件矛盾. 因此 f 在 D 的内部不可能取到最大值. 同理可证也不可能取到最小值. $\square$

10. 设 $f(x, y, z)$ 在 $\bar{B}_R(P_0)$ 上有二阶连续偏导数, 且满足 Laplace 方程

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} = 0,$$

求证: 对 $0 \leq r \leq R$, 有

$$f(P_0) = \frac{1}{4\pi r^2} \iint_{\partial B_r(P_0)} f(x, y, z) dS$$

, 其中 $P_0(x_0, y_0, z_0), B_r(P_0) : (x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 \leq r^2, 0 \leq r \leq R$.

证明 类似第 8 题的证明, 取球面 $\partial B_r(P_0)$ 的参数方程表示

$$x = x_0 + r \sin \theta \cos \varphi, \quad y = y_0 + r \sin \theta \sin \varphi, \quad z = z_0 + r \cos \theta, \quad 0 \leq \theta \leq \pi, \quad 0 \leq \varphi \leq 2\pi$$

并记

$$\begin{aligned} g(r) &= \frac{1}{4\pi r^2} \iint_{\partial B_r(P_0)} f(x, y, z) dS \\ &= \frac{1}{4\pi} \int_0^\pi \int_0^{2\pi} f(x_0 + r \sin \theta \cos \varphi, y_0 + r \sin \theta \sin \varphi, z_0 + r \cos \theta) \sin \theta d\theta d\varphi \end{aligned}$$

对 r 求导得

$$\begin{aligned} g'(r) &= \frac{1}{4\pi} \int_0^\pi \int_0^{2\pi} \left(\frac{\partial f}{\partial x} \sin \theta \cos \varphi + \frac{\partial f}{\partial y} \sin \theta \sin \varphi + \frac{\partial f}{\partial z} \cos \theta \right) \sin \theta d\theta d\varphi \\ &= \frac{1}{4\pi r^2} \iint_{\partial B_r(P_0)} \frac{\partial f}{\partial x} dy dz + \frac{\partial f}{\partial y} dz dx + \frac{\partial f}{\partial z} dx dy \\ &= \frac{1}{4\pi r^2} \iiint_{B_r(P_0)} \Delta f dx dy dz = 0 \end{aligned}$$

所以 $g(r)$ 是常值函数:

$$g(r) = g(0) = \frac{1}{4\pi} \int_0^\pi \int_0^{2\pi} f(x_0, y_0, z_0) \sin \theta d\theta d\varphi = f(P_0).$$

□

12 Fourier 分析

12.1 习题 函数的 Fourier 级数

1. 作出下列周期 2π 的函数的图形, 并把它们展开成 Fourier 级数 (说明收敛情况).

(1) 在 $[-\pi, \pi)$ 中, $f(x) = \begin{cases} -\pi, & -\pi \leq x \leq 0 \\ x, & 0 < x < \pi \end{cases}$

(2) 在 $[-\pi, \pi)$ 中, $f(x) = \cos \frac{x}{2}$;

(3) 在 $[-\pi, \pi)$ 中, $f(x) = \begin{cases} e^x, & -\pi \leq x \leq 0 \\ 1, & 0 \leq x < \pi \end{cases}$

解: (1)

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_0^{\pi} x dx - \int_{-\pi}^0 1 dx = -\frac{\pi}{2} \\ a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx = -\frac{\pi}{\pi} \int_{-\pi}^0 \cos nx dx + \frac{1}{\pi} \int_0^{\pi} x \cos nx \\ &= -\frac{1}{n} (\sin 0 + \sin \pi) + \frac{1}{\pi} \left(\frac{1}{n} x \sin nx \right) \Big|_0^{\pi} + \left(-\frac{1}{\pi n} \right) \int_0^{\pi} \sin nx dx \\ &= \frac{\cos n\pi - 1}{n^2 \pi} = \frac{(-1)^n - 1}{n^2 \pi} \\ b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = -\frac{\pi}{\pi} \int_{-\pi}^0 \sin nx dx + \frac{1}{\pi} \int_0^{\pi} x \sin nx dx \\ &= \frac{1}{n} (\cos nx) \Big|_{-\pi}^0 + \left(-\frac{1}{n\pi} x \cos nx \right) \Big|_0^{\pi} + \frac{1}{\pi} \int_0^{\pi} \cos nx dx \\ &= \frac{1 - (-1)^n}{n} + \frac{-\pi(-1)^n}{n\pi} = \frac{1 - 2(-1)^n}{n} \end{aligned}$$

Dirichlet con Th

$$\begin{aligned} f(x) &\sim -\frac{\pi}{4} + \sum_{n=1}^{\infty} \left(\frac{(-1)^n - 1}{n^2 \pi} \cos nx + \frac{1 - 2(-1)^n}{n} \sin nx \right) \\ &= \begin{cases} f(x), & x \neq k\pi \\ -\frac{\pi}{2}, & x = 2k\pi \\ 0, & x = (2k-1)\pi \end{cases} \end{aligned}$$

(2)

$$\begin{aligned}
a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} \cos \frac{x}{2} dx = \frac{2}{\pi} \left(\sin \frac{x}{2} \right) \Big|_{-\pi}^{\pi} = \frac{4}{\pi} \\
a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} \cos \frac{x}{2} \cos nx dx = \frac{1}{\pi} \left(\frac{n \sin nx \cos \frac{1}{2}x - \frac{1}{2} \cos nx \sin \frac{1}{2}x}{n^2 - \frac{1}{4}} \right) \Big|_{-\pi}^{\pi} \\
&= \frac{-\cos n\pi}{\pi (n^2 - \frac{1}{4})} = \frac{4(-1)^{n+1}}{\pi(4n^2 - 1)} \\
b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} \cos \frac{x}{2} \sin nx dx = \frac{1}{\pi} \left(\frac{-\frac{1}{2} \sin \frac{x}{2} \sin nx - n \cos nx \cos \frac{x}{2}}{n^2 - \frac{1}{4}} \right) \Big|_{-\pi}^{\pi} \\
&= \frac{1}{\pi} \cdot 0 = 0,
\end{aligned}$$

Dirichlet con Th

$$f(x) = \frac{2}{\pi} + \sum_{n=1}^{\infty} \frac{4(-1)^{n+1}}{\pi(4n^2 - 1)} \cos nx$$

(3)

$$\begin{aligned}
a_0 &= \frac{1}{\pi} \int_{-\pi}^0 e^x dx + \frac{1}{\pi} \int_0^{\pi} 1 dx = \frac{\pi + 1 - e^{-\pi}}{\pi} \\
a_n &= \frac{1}{\pi} \int_{-\pi}^0 e^x \cos nx dx + \frac{1}{\pi} \int_0^{\pi} \cos nx dx \\
&= \frac{1}{\pi} \left(\frac{e^x (n \sin x + \cos nx)}{n^2 + 1} \right) \Big|_{-\pi}^0 \\
&= \frac{1 - e^{-\pi}(-1)^n}{\pi (n^2 + 1)} \\
b_n &= \frac{1}{\pi} \int_{-\pi}^0 e^x \sin nx dx + \frac{1}{\pi} \int_0^{\pi} \sin nx dx \\
&= \frac{1}{\pi} \left(\frac{e^x (\sin nx - n \cos nx)}{n^2 + 1} \right) \Big|_{-\pi}^0 + \frac{(-1)^n - 1}{n\pi} \\
&= \frac{n(e^{-\pi}(-1)^n - 1)}{\pi (n^2 + 1)} + \frac{1 - (-1)^n}{n\pi}
\end{aligned}$$

Dirichlet con Th

$$f(x) = \frac{\pi + 1 - e^{-\pi}}{2\pi} + \sum_{n=1}^{\infty} \left(\frac{1 - e^{-\pi}(-1)^n}{\pi (n^2 + 1)} \cos nx + \left(\frac{n(e^{-\pi}(-1)^n - 1)}{\pi (n^2 + 1)} + \frac{1 - (-1)^n}{n\pi} \right) \sin nx \right)$$

2 将下列函数展开成以指定区间长度为周期的 Fourier 级数, 并说明收敛情况

(1) $f(x) = 1 - \sin \frac{x}{2} (0 \leq x \leq \pi);$

(2) $f(x) = \frac{x}{3} (0 \leq x \leq T);$

(3) $f(x) = e^{ax} (-l \leq x \leq l);$

(4) $f(x) = \begin{cases} 1, & |x| < 1 \\ -1, & 1 \leq |x| \leq 2 \end{cases}$

解:

(1)

$$2l = \pi - 0 = \pi, \omega = 2n$$

$$a_0 = \frac{1}{l} \int_0^\pi \left(1 - \sin \frac{x}{2}\right) dx = \frac{2 \left(x + 2 \cos \frac{x}{2}\right) \Big|_0^\pi}{\pi} = \frac{2(\pi - 2)}{\pi}$$

$$a_n = \frac{2}{\pi} \int_0^\pi \left(1 - \sin \frac{x}{2}\right) \cos 2nx dx = \frac{2}{\pi} \left(\frac{1}{4n-1} - \frac{1}{4n+1} \right)$$

$$b_n = \frac{1}{l} \int_0^\pi \left(1 - \sin \frac{x}{2}\right) \sin 2nxdx = \frac{2}{\pi} \left(-\frac{\cos 2nx}{2n} + \frac{\sin(2n + \frac{1}{2})x}{4n+1} + \frac{\sin(\frac{1}{2} - 2n)x}{4n-1} \right) \Big|_0^\pi = 0$$

$$\begin{aligned} f(x) &\sim \frac{\pi-2}{\pi} + \sum_{n=1}^{\infty} \frac{2}{\pi} \left(\frac{1}{4n-1} - \frac{1}{4n+1} \right) \cos 2nx \\ &= \begin{cases} f(x), & x \neq k\pi \\ \frac{1}{2}, & x = k\pi \end{cases} \end{aligned}$$

(2)

$$2l = T - 0 = T, \omega = \frac{2n\pi}{T}$$

$$a_0 = \frac{2}{T} \int_0^T \frac{x}{3} dx = \frac{T}{3},$$

$$\begin{aligned} a_n &= \frac{1}{l} \int_0^T \frac{x}{3} \cos \omega x dx = \frac{2}{3T} \left(\frac{\cos \omega x + \omega x \sin \omega x}{\omega^2} \right) \Big|_0^T \\ &= \frac{2(\cos \omega T + \omega T \sin \omega - 1)}{3\omega^2 T} = 0 \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{l} \int_0^T \frac{x}{3} \sin \omega x dx = \frac{2}{3T} \left(\frac{\sin \omega x - \omega x \cos \omega x}{\omega^2} \right) \Big|_0^T \\ &= \frac{2(\sin \omega T - \omega T \cos \omega T)}{3\omega^2 T} = \frac{-T}{3n\pi} \end{aligned}$$

$$\begin{aligned} f(x) &\sim \frac{T}{6} - \sum_{n=1}^{\infty} \frac{T}{3n\pi} \sin \frac{2n\pi}{T} x \\ &= \begin{cases} f(x), & x \neq kT \\ \frac{T}{6}, & x = kT \end{cases} \end{aligned}$$

(3)

$$\begin{aligned}
a_0 &= \frac{1}{l} \int_{-l}^l e^{ax} dx = \frac{1}{l} \left. \frac{1}{a} e^{ax} \right|_{-l}^l = \frac{1}{al} (e^{al} - e^{-al}), \quad \omega = \frac{n\pi}{l}. \\
a_n &= \frac{1}{l} \int_{-l}^l e^{ax} \cos \omega x dx = \frac{1}{l} \left. \frac{ae^{ax} \cos \omega x + \omega e^{ax} \sin \omega x}{a^2 + \omega^2} \right|_{-l}^l = \frac{1}{l} \frac{a(e^{al} - e^{-al})(-1)^n}{a^2 + \omega^2} = \frac{al(e^{al} - e^{-al})(-1)^n}{a^2 l^2 + n^2 \pi^2} \\
b_n &= \frac{1}{l} \int_{-l}^l e^{ax} \sin \omega x dx = \frac{1}{l} \left. \frac{ae^{ax} \sin \omega x - \omega e^{ax} \cos \omega x}{a^2 + \omega^2} \right|_{-l}^l = -\frac{n\pi(e^{al} - e^{-al})(-1)^n}{a^2 l^2 + n^2 \pi^2} \\
f(x) &\sim \frac{e^{al} - e^{-al}}{2al} + \sum_{n=1}^{\infty} \frac{(e^{al} - e^{-al})(-1)^n}{a^2 l^2 + n^2 \pi^2} \left(al \cos \frac{n\pi x}{l} - n\pi \sin \frac{n\pi x}{l} \right) \\
&= \begin{cases} e^{ax}, & x \neq (2k-1)l, \\ \frac{e^{-al} + e^{al}}{2}, & x = (2k-1)l \end{cases} \\
l &= 2, \quad a_0 = \frac{1}{2} \int_{-2}^2 f(x) dx = 0, \quad \omega_n = \frac{n\pi}{2} \\
(4) \quad a_n &= \frac{1}{2} \int_{-2}^2 f(x) \cos \omega_n x dx = \int_0^1 \cos \omega_n x dx - \int_1^2 \cos \omega_n x dx = \frac{4 \sin(\frac{n\pi}{2})}{n\pi} \\
b_n &= 0, \quad f(x) \sim \sum_{n=1}^{\infty} \frac{4 \sin(\frac{n\pi}{2})}{n\pi} \cos \frac{n\pi x}{2} = \begin{cases} f(x), & x \neq 2k \pm 1 \\ 0, & x = 2k \pm 1. \end{cases}
\end{aligned}$$

3. 把下列函数展开成正弦级数和余弦级数:

$$\begin{aligned}
(1) \quad f(x) &= 2x^2 \quad (0 \leq x \leq \pi); \\
(2) \quad f(x) &= \begin{cases} A, & 0 \leq x < \frac{1}{2}, \\ 0, & \frac{1}{2} \leq x \leq l \end{cases}, \\
(3) \quad f(x) &= \begin{cases} 1 - \frac{x}{2h}, & 0 \leq x \leq 2h \\ 0, & 2h < x \leq \pi \end{cases}
\end{aligned}$$

解: (1) 先分别作奇延拓和偶延拓, 再作 2π 周期延拓。正弦系数与余弦系数为

$$\begin{aligned}
b_n &= \frac{2}{\pi} \int_0^\pi 2x^2 \sin nx dx = -\frac{4\pi(-1)^n}{n} + \frac{8((-1)^n - 1)}{\pi n^3}, \\
a_0 &= \frac{2}{\pi} \int_0^\pi 2x^2 dx = \frac{4\pi^2}{3}, \quad a_n = \frac{2}{\pi} \int_0^\pi 2x^2 \cos nx dx = \frac{8(-1)^n}{n^2}.
\end{aligned}$$

故

$$\begin{aligned}
2x^2 &\sim \sum_{n=1}^{\infty} \left[-\frac{4\pi(-1)^n}{n} + \frac{8((-1)^n - 1)}{\pi n^3} \right] \sin nx, \\
2x^2 &= \frac{2\pi^2}{3} + \sum_{n=1}^{\infty} \frac{8(-1)^n}{n^2} \cos nx \quad (0 < x < \pi).
\end{aligned}$$

(2) 假设 $l \geq \frac{1}{2}$ 。相应半区间展开为

$$\begin{aligned} b_n &= \frac{2A}{n\pi} \left(1 - \cos \frac{n\pi}{2l}\right), \\ a_0 &= \frac{A}{l}, \quad a_n = \frac{2A}{n\pi} \sin \frac{n\pi}{2l}, \\ f(x) &\sim \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}, \\ f(x) &\sim \frac{A}{2l} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l}. \end{aligned}$$

(3) 设 $0 < 2h \leq \pi$, 则

$$\begin{aligned} b_n &= \frac{2}{\pi} \left(\frac{1}{n} - \frac{\sin(2nh)}{2hn^2} \right), \\ a_0 &= \frac{2h}{\pi}, \quad a_n = \frac{2}{\pi} \frac{1 - \cos(2nh)}{2hn^2}, \\ f(x) &\sim \sum_{n=1}^{\infty} b_n \sin nx, \\ f(x) &\sim \frac{h}{\pi} + \sum_{n=1}^{\infty} a_n \cos nx. \end{aligned}$$

4. 已知函数的 Fourier 级数展开式, 求常数 a 的值.

- (1) $\sum_{n=1}^{\infty} \frac{\cos(2n-1)x}{(2n-1)^2} = a(2a - |x|)$, 其中 $-\pi \leq x \leq \pi$;
 (2) $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} \sin nx = ax$, 其中 $-\pi < x < \pi$.

解: (1) $a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{2a}{\pi} \int_0^{\pi} (2a - x) dx = \frac{2a}{\pi} \left(2ax - \frac{1}{2}x^2 \right) \Big|_0^{\pi} = 0, a = \frac{\pi}{4}$
 (2) $b_n = \frac{2}{\pi} \int_0^{\pi} ax \sin nx \, dx = -\frac{2a}{n} \cos n\pi = \frac{(-1)^{n-1}}{n}, a = \frac{1}{2}.$

5.(1) 设

$$\begin{aligned} f(x) &= \begin{cases} x, & 0 \leq x \leq \frac{1}{2} \\ 2-2x, & \frac{1}{2} < x < 1 \end{cases} \\ S(x) &= \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos n\pi x, \quad -\infty < x < +\infty \end{aligned}$$

其中 $a_n = 2 \int_0^1 f(x) \cos n\pi x \, dx (n=0, 1, 2, \dots)$. 求 $S(\frac{9}{4}), S(-\frac{5}{2})$;

(2) 设 $f(x) = \begin{cases} -1, & -\pi < x \leq 0, \\ 1+x^2, & 0 < x \leq \pi, \end{cases}$ 则其以 2π 为周期的 Fourier 级数的和函数为

$S(x) (-\infty < x < +\infty)$. 求 $S(3\pi), S(-4\pi)$.

解:

(1) $f(x)$ 偶延拓到 y 轴对称区间, 则 $S(x)$ 为 $f(x)$ 的余弦级数

$$S\left(\frac{9}{4}\right) = S\left(\frac{1}{4}\right) = f\left(\frac{1}{4}\right) = \frac{1}{4},$$

$$S\left(-\frac{5}{2}\right) = S\left(\frac{5}{2}\right) = S\left(\frac{1}{2}\right) = \frac{f\left(\frac{1}{2}+0\right) + f\left(\frac{1}{2}-0\right)}{2} = \frac{1}{2}\left(\frac{1}{2}+1\right) = \frac{3}{4}.$$

$$(2) S(3\pi) = S(\pi) = \frac{(1+\pi^2)-1}{2} = \frac{\pi^2}{2}$$

$$S(-4\pi) = S(0) = \frac{1-1}{2} = 0$$

6. 设 $f(x)$ 是一个以 2π 为周期的函数,

(1) 如果 $f(x \pm \pi) = -f(x)$, 试证明 $f(x)$ 在 $(-\pi, \pi)$ 内的 Fourier 展开只含有奇次谐波, 即

$$a_{2n} = 0 (n = 0, 1, 2, \dots), \quad b_{2n} = 0 \quad (n = 1, 2, \dots)$$

证明:

(1) 不妨 $f(x + \pi) = -f(x)$

$$\begin{aligned} a_{2n} &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos 2nxdx = \frac{1}{\pi} \int_0^{\pi} f(x) \cos(2nx)dx + \frac{1}{\pi} \int_{-\pi}^0 f(x) \cos 2nxdx \\ &= \frac{1}{\pi} \int_0^{\pi} f(x) \cos 2nxdx + \frac{1}{\pi} \int_0^{\pi} -f(t) \cos(2nt - 2n\pi)dt = 0 \quad (n = 0, 1, 2, \dots) \\ b_{2n} &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin 2nxdx = \frac{1}{\pi} \int_{-\pi}^0 f(x) \sin 2nxdx + \frac{1}{\pi} \int_0^{\pi} f(x) \sin 2nxdx \\ &= \frac{1}{\pi} \int_0^{\pi} -f(t) \sin(2nt - 2n\pi)dt + \frac{1}{\pi} \int_0^{\pi} f(x) \sin 2nxdx = 0 \quad (n = 1, 2, \dots) \end{aligned}$$

□

(2) 如果 $f(x \pm \pi) = f(x)$, 试证明 $f(x)$ 在 $(-\pi, \pi)$ 内的 Fourier 展开只含有偶次谐波, 即

$$a_{2n-1} = b_{2n-1} = 0 \quad (n = 1, 2, \dots)$$

证明:

(2) 不妨 $f(x) = f(x + \pi)$,

$$\begin{aligned} a_{2n-1} &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos(2n-1)x dx = \frac{1}{\pi} \int_{-\pi}^0 f(x) \cos(2n-1)x dx + \frac{1}{\pi} \int_0^{\pi} f(x) \cos(2n-1)x dx \\ &= \frac{1}{\pi} \int_0^{\pi} f(t) \cos((2n-1)t - (2n-1)\pi) dt + \frac{1}{\pi} \int_0^{\pi} f(x) \cos(2n-1)x dx = 0 \quad (n=1, 2, \dots) \\ b_{2n-1} &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin(2n-1)x dx = \frac{1}{\pi} \int_{-\pi}^0 f(x) \sin(2n-1)x dx + \frac{1}{\pi} \int_0^{\pi} f(x) \sin(2n-1)x dx \\ &= \frac{1}{\pi} \int_0^{\pi} f(t) \sin((2n-1)t - (2n-1)\pi) dt + \frac{1}{\pi} \int_0^{\pi} f(x) \sin(2n-1)x dx = 0 \quad (n=1, 2, \dots) \end{aligned}$$

□

7. 已知周期为 2π 的函数 $f(x)$ 的 Fourier 系数是 a_n 和 b_n , 试证明 “平移” 了的函数 $f(x+h)$ ($h = \text{常数}$) 的 Fourier 系数为

$$\begin{aligned} \bar{a}_n &= a_n \cos nh + b_n \sin nh \quad (n=0, 1, 2, \dots) \\ \bar{b}_n &= b_n \cos nh - a_n \sin nh \quad (n=1, 2, \dots) \end{aligned}$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx, \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx \\ \bar{a}_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x+h) \cos nx dx = \frac{1}{\pi} \int_{-\pi+h}^{\pi+h} f(u) \cos(u-h) ndu = a_n \cos nh + b_n \sin nh \\ \bar{b}_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x+h) \sin nx dx = \frac{1}{\pi} \int_{-\pi+h}^{\pi+h} f(u) \sin(u-h) ndu = b_n \cos nh - a_n \sin nh \end{aligned}$$

□

8. 将 $y = 1 - x^2$ 在 $[-\pi, \pi]$ 上展开成 Fourier 级数, 并利用其结果求下列级数的和:

$$(1) \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} (2) \sum_{n=1}^{\infty} \frac{1}{n^4}.$$

解:

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} (1-x^2) dx = \frac{1}{\pi} \left(x - \frac{x^3}{3} \right) \Big|_{-\pi}^{\pi} = 2 - \frac{2\pi^2}{3} \\ a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} (1-x^2) \cos nx dx = -\frac{4 \cos(n\pi)}{n^2} = -\frac{4(-1)^n}{n^2} \\ b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} (1-x^2) \sin nx dx = 0 \end{aligned}$$

$$\begin{aligned}
f(x) &= 1 - x^2 = 1 - \frac{\pi^2}{3} + \sum_{n=1}^{\infty} \left(-\frac{4 \cos n\pi}{n^2} \right) \cos nx, \\
x^2 + \sum_{n=1}^{\infty} \frac{-4 \cos n\pi}{n^2} \cos nx &= \frac{\pi^2}{3} \\
x=0, \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} &= \frac{\pi^2}{12} \\
\frac{x^3}{3} + \sum_{n=1}^{\infty} \frac{4(-1)^{n-1} \sin nx}{n^3} &= \frac{\pi^2}{3} x \\
\frac{x^4}{12} + 4 \sum_{n=1}^{\infty} \frac{(-1)^{n-1} (1 - \cos nx)}{n^4} &= \frac{\pi^2 x^2}{6} \\
x=\pi, \sum_{n=1}^{\infty} \frac{1}{(2n-1)^4} &= \frac{\pi^4}{96}, \\
\sum_{n=1}^{\infty} \frac{1}{n^4} &= \frac{16}{15} \cdot \frac{\pi^4}{96} = \frac{\pi^4}{90}.
\end{aligned}$$

9. 将 $f(x) = 1 + x (0 \leq x \leq \pi)$ 展成周期为 2π 的余弦级数, 并求

$$(1) \sum_{n=1}^{\infty} \frac{\cos(2n-1)}{(2n-1)^2}; \quad (2) \sum_{n=1}^{\infty} \frac{\cos 4(2n-1)}{(2n-1)^2}.$$

解:

$$\begin{aligned}
a_0 &= \frac{2}{\pi} \int_0^{\pi} (1+x) dx = \frac{2}{\pi} \left(x + \frac{1}{2} x^2 \right) \Big|_0^{\pi} = 2 + \pi \\
a_n &= \frac{2}{\pi} \int_0^{\pi} (1+x) \cos nx \, dx \\
&= \frac{2}{\pi} \cdot \frac{1}{n} \left(\sin nx + x \sin nx + \frac{1}{n} \cos nx \right) \Big|_0^{\pi} \\
&= \frac{2}{\pi n^2} ((-1)^n - 1), \\
f(x) &= 1 + \frac{\pi}{2} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{\cos(2n-1)x}{(2n-1)^2}
\end{aligned}$$

$$x=1, f(1) = 1 + \frac{\pi}{2} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{\cos(2n-1)}{(2n-1)^2} = 2$$

$$\sum_{n=1}^{\infty} \frac{\cos(2n-1)}{(2n-1)^2} = \frac{\pi}{4} \left(\frac{\pi}{2} - 1 \right)$$

$$x=4, f(4) = f(2\pi-4) = 2\pi-3 = 1 + \frac{\pi}{2} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{\cos 4(2n-1)}{(2n-1)^2}$$

$$\sum_{n=1}^{\infty} \frac{\cos 4(2n-1)}{(2n-1)^2} = \frac{\pi}{8} (8-3\pi)$$

10. 设 $f(x)$ 在 $[-\frac{T}{2}, \frac{T}{2}]$ 这个周期上可表示为

$$f(x) = \begin{cases} 0, & -\frac{T}{2} \leq x < -\frac{\tau}{2} \\ H, & -\frac{\tau}{2} \leq x < \frac{\tau}{2} \\ 0, & \frac{\tau}{2} \leq x \leq \frac{T}{2} \end{cases}$$

试把它展开成 Fourier 级数的复数形式.

解:

$$\begin{aligned} a_0 &= \frac{2}{l} \int_0^{\frac{\tau}{2}} H \, dx = \frac{\tau}{l} H = \frac{2\tau H}{T} \\ a_n &= \frac{2}{l} \int_0^{\frac{\tau}{2}} H \cos \frac{n\pi}{l} x \, dx = \frac{2H}{l} \cdot \frac{l}{n\pi} \sin \frac{n\pi}{l} x \Big|_0^{\frac{\tau}{2}} = \frac{2H}{n\pi} \sin \frac{\tau n\pi}{2l}, \\ f(x) &\sim \sum_{-\infty}^{+\infty} F_n e^{i\frac{2n\pi}{T}x} = \begin{cases} f(x), & x \neq \frac{(2k-1)\tau}{2}, \\ \frac{H}{2}, & x = \frac{(2k-1)\tau}{2}, \end{cases} \\ F_0 &= \frac{1}{2} a_0 = \frac{\tau H}{T}, \quad F_{\pm n} = \frac{1}{2} a_n = \frac{H}{n\pi} \sin \frac{\tau n\pi}{T}. \end{aligned}$$

12.2 习题 平方平均收敛

1. 将 $f(x) = \begin{cases} 1, & |x| < a, \\ 0, & a \leq |x| < \pi \end{cases}$ 展开成 Fourier 级数, 然后利用 Parseval 等式求下列级数的和: (1) $\sum_{n=1}^{\infty} \frac{\sin^2 na}{n^2}$; (2) $\sum_{n=1}^{\infty} \frac{\cos^2 na}{n^2}$.

解:

$f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = f(-x)$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{2a}{\pi}, b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = 0$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{2}{\pi} \int_0^a \cos nx dx = \frac{2 \sin na}{n\pi}$$

$$f(x) \sim F(x)|_{[-\pi, \pi]} = \frac{a}{\pi} + \sum_{n=1}^{\infty} \frac{2}{n\pi} \sin na \cos nx = \begin{cases} f(x), & |x| \neq a, \\ \frac{1}{2}, & |x| = a \end{cases}$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi} f^2(x) dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2)$$

$$\sum_{n=1}^{\infty} \frac{\sin^2 na}{n^2} = \frac{a\pi}{2} - \frac{a^2}{2}, \sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$$

$$\sum_{n=1}^{\infty} \frac{\cos^2 na}{n^2} = \frac{\pi^2}{6} + \frac{a^2}{2} - \frac{a\pi}{2}$$

2. 设 $f(x)$ 是 $[-\pi, \pi]$ 上可积且平方可积的函数, a_n, b_n 是 $f(x)$ 的 Fourier 系数. 求证: $\sum_{n=1}^{\infty} \frac{a_n}{n}$ 和 $\sum_{n=1}^{\infty} \frac{b_n}{n}$ con.

证明:

$$f(x) \in L^2[-\pi, \pi], \quad \frac{1}{\pi} \int_{-\pi}^{\pi} f^2(x) dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2)$$

$$\therefore \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \text{ abs con, } \sum_{n=1}^{\infty} a_n^2 \text{ abs con}$$

$$\therefore \text{均值不等式 } \frac{|a_n|}{n} \leq \frac{1}{2} \left(a_n^2 + \frac{1}{n^2} \right), \therefore \sum_{n=1}^{\infty} \frac{a_n}{n} \text{ 绝对收敛, } \sum_{n=1}^{\infty} \frac{b_n}{n} \text{ 同理}$$

□

3. 求周期为 2π 函数 $f(x) = \begin{cases} -1, & -\pi < x < 0 \\ 1, & 0 \leq x \leq \pi \end{cases}$ 的 Fourier 级数, 并求 $\sum_{n=1}^{\infty} \frac{1}{(2n-1)^2}$ 的和以及 $\sum_{n=1}^{\infty} \frac{\cos(2n-1)x}{(2n-1)^2}, (0 \leq x \leq \pi)$ 的和.

解:

$f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = -f(-x)$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0, a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^{\pi} \sin nx dx = \frac{2(1 - (-1)^n)}{n\pi}$$

$$f(x) \sim F(x)|_{[-\pi, \pi]} = \sum_{n=1}^{\infty} \frac{2}{n\pi} (1 - (-1)^n) \sin nx = \begin{cases} f(x), & x \neq 0, \pm\pi, \\ 0, & x = 0, \pm\pi \end{cases}$$

$$f(x) = \sum_{n=1}^{\infty} \frac{4 \sin(2n-1)x}{(2n-1)\pi} = 1, \quad x \in (0, \pi) \quad \sum_{n=1}^{\infty} \frac{\sin(2n-1)x}{(2n-1)} = \frac{\pi}{4}, \quad \sum_{n=1}^{\infty} -\frac{\cos(2n-1)x}{(2n-1)^2} = \frac{\pi x}{4} - \frac{\pi^2}{8}$$

$$\therefore x = \pi, \quad \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} = \frac{\pi^2}{8}, \quad \sum_{n=1}^{\infty} \frac{\cos(2n-1)x}{(2n-1)^2} = \frac{\pi^2}{8} - \frac{\pi x}{4}$$

注: 此处除了积分还可以用 Parseval 等式做

常见结论

$$\begin{aligned} \sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\cos(2n-1)x}{(2n-1)^2} &= -x + \frac{\pi}{2} \Rightarrow \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} = \frac{\pi^2}{8} \\ \sum_{n=1}^{\infty} \frac{1}{n^2} &= \frac{\pi^2}{6} \left(\frac{\pi^2}{8} + \frac{s}{4} = s \right), \quad \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} = \frac{\pi^2}{12} \\ \sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\sin(2n-1)x}{(2n-1)^3} &= \frac{\pi}{2}x - \frac{x^2}{2}, \quad \sum_{n=1}^{\infty} \frac{4}{\pi} \cdot \frac{\cos(2n-1)x - 1}{(2n-1)^4} = \frac{x^3}{6} - \frac{\pi x^2}{4} \\ \sum_{n=1}^{\infty} \frac{1}{(2n-1)^4} &= \frac{\pi^4}{96}, \quad \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90}, \quad \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^4} = \frac{7\pi^4}{720} \end{aligned}$$

4. 证明下列函数系是正交系, 并求其对应的标准正交系.

- (1) $1, \cos x, \cos 2x, \dots, \cos nx, \dots$, 在 $[0, \pi]$ 上;
- (2) $\sin \frac{\pi}{l}x, \sin \frac{2\pi}{l}x, \dots, \sin \frac{n\pi}{l}x, \dots$, 在 $[0, l]$ 上;
- (3) $\sin x, \sin 3x, \dots, \sin(2n+1)x, \dots$, 在 $[0, \frac{\pi}{2}]$ 上;
- (4) $\cos \frac{\pi}{2l}x, \cos \frac{3\pi}{2l}x, \dots, \cos \frac{(2n+1)\pi}{2l}x, \dots$, 在 $[0, l]$ 上.

解: (1)

$$\langle \cos mx, \cos nx \rangle = \begin{cases} \pi, & m = n = 0, \\ \frac{\pi}{2}, & m = n \geq 1, \\ 0, & m \neq n \end{cases} \quad \text{标准正交系} \left\{ \frac{1}{\sqrt{\pi}}, \sqrt{\frac{2}{\pi}} \cos nx \ (n \geq 1) \right\}$$

(2)

$$\begin{aligned}
 \left\langle \sin \frac{m\pi}{l}x, \sin \frac{n\pi}{l}x \right\rangle &= \int_0^l \sin \frac{m\pi x}{l} \sin \frac{n\pi x}{l} dx \\
 &= \left(\frac{\sin((m-n)\pi x)}{2\pi(m-n)} - \frac{\sin((m+n)\pi x)}{2\pi(m+n)} \right) \Big|_0^l = 0 \\
 \left\| \sin \frac{n\pi x}{l} \right\|^2 &= \frac{l}{2} \quad \text{标准正交系} \left\{ \sqrt{\frac{2}{l}} \sin \frac{n\pi x}{l} \right\} \quad (n=1, 2, \dots)
 \end{aligned}$$

(3)

$$\langle \sin(2m+1)x, \sin(2n+1)x \rangle = \begin{cases} \frac{\pi}{4}, & m=n \\ 0, & m \neq n \end{cases} \quad \text{标准正交系} \left\{ \frac{2}{\sqrt{\pi}} \sin(2n+1)x \right\} \quad (n=0, 1, \dots)$$

(4)

$$\begin{aligned}
 \left\langle \cos \frac{(2m+1)\pi}{2l}x, \cos \frac{(2n+1)\pi}{2l}x \right\rangle &= \int_0^l \cos \frac{(2m+1)\pi}{2l}x \cos \frac{(2n+1)\pi}{2l}x dx \\
 &= \frac{1}{2} \int_0^l \left(\cos \frac{(m-n)\pi}{l}x + \cos \frac{(m+n+1)\pi}{l}x \right) dx \\
 &= \frac{1}{2} \left(\frac{l}{(m-n)\pi} \sin \frac{(m-n)\pi}{l}x + \frac{l}{(m+n+1)\pi} \sin \frac{(m+n+1)\pi}{l}x \right) \Big|_0^l = 0, \\
 \left\| \cos \frac{(2n+1)\pi}{2l}x \right\|^2 &= \int_0^l \cos^2 \frac{(2n+1)\pi}{2l}x dx \\
 &= \left(\frac{1}{2}x + \frac{l}{(2n+1)\pi} \sin \frac{(2n+1)\pi}{l}x \right) \Big|_0^l \\
 &= \frac{l}{2} \\
 &\text{标准正交系} \left\{ \sqrt{\frac{2}{l}} \cos \frac{(2n+1)\pi x}{2l} \right\} \quad (n=0, 1, \dots)
 \end{aligned}$$

□

5. 将 $f(x) = a(1 - \frac{x}{l})$ ($0 \leq x \leq l$) 按第 4 题中 (2) 的函数系展开成广义 Fourier 级数.

解:

$$\begin{aligned}
 a_n &= \int_0^l a \left(1 - \frac{x}{l}\right) \sin \frac{n\pi x}{l} dx \\
 &= \left(\frac{al}{n\pi} \left(-\cos \frac{n\pi x}{l} \right) - \frac{a}{l} \frac{\left(\sin \frac{n\pi x}{l} - \frac{n\pi x}{l} \cos \frac{n\pi x}{l} \right)}{n^2\pi^2} \right) \Big|_0^l \\
 &= \frac{al}{n\pi}
 \end{aligned}$$

$$\text{广义 Fourier 级数} \quad f(x) \sim \sum_{n=1}^{\infty} \frac{2a}{n\pi} \sin \frac{n\pi x}{l}.$$

6. 将 $f(x) = x(0 \leq x \leq l)$ 按第 4 题中 (4) 的函数系展开成广义 Fourier 级数.

解:

$$\begin{aligned} a_n &= \int_0^l x \cos \frac{(2n+1)\pi x}{2l} dx \\ &= \left(\frac{\cos \frac{(2n+1)\pi x}{2l} + \frac{(2n+1)\pi}{2l} x \cdot \sin \frac{(2n+1)\pi x}{2l}}{\left(\frac{(2n+1)\pi}{2l}\right)^2} \right) \Big|_0^l \\ &= \frac{4l^2 \left(\frac{(-1)^n (2n+1)}{2} - 1 \right)}{(2n+1)^2 \pi^2} \end{aligned}$$

$$\text{广义 Fourier 级数 } f(x) \sim \sum_{n=0}^{\infty} \left(\frac{4l(-1)^n}{(2n+1)\pi} - \frac{8l}{(2n+1)^2 \pi^2} \right) \cos \frac{(2n+1)\pi x}{2l}.$$

7. 证明 Legendre 多项式

$$P_n(x) = \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n \quad (n = 0, 1, 2, \dots)$$

(它是一个 n 次多项式) 在区间 $[-1, 1]$ 上构成一个正交系. 提示: 不断使用分部积分并注意到当 $1 \leq k \leq n$ 时, $\frac{d^{n-k}}{dx^{n-k}} (x^2 - 1)^n \Big|_{x=\pm 1} = 0$.

证明: 证明: 设 $0 \leq m < n$. 由 Rodrigues 公式,

$$\int_{-1}^1 P_m(x) P_n(x) dx = \frac{1}{2^n n!} \int_{-1}^1 P_m(x) \frac{d^n}{dx^n} (x^2 - 1)^n dx.$$

由于 $(x^2 - 1)^n$ 在 $x = \pm 1$ 均有 n 重零点, 连续分部积分 n 次时所有边界项都为零, 于是

$$\int_{-1}^1 P_m P_n dx = \frac{(-1)^n}{2^n n!} \int_{-1}^1 P_m^{(n)}(x) (x^2 - 1)^n dx = 0,$$

因为 P_m 的次数为 $m < n$, 故 $P_m^{(n)} \equiv 0$. 交换 m, n 即得任意 $m \neq n$ 时正交. $\square$

8. Legendre 多项式有一些很好的性质和应用, 请验证 Legendre 多项式满足

(1) $y = P_n(x)$ 是下列方程的解

$$(1 - x^2) \frac{d^2 P(x)}{dx^2} - 2x \frac{dP(x)}{dx} + n(n+1)P(x) = 0$$

(2) 相邻的三个 Legendre 多项式满足

$$\begin{aligned} (n+1)P_{n+1} &= (2n+1)xP_n - nP_{n-1} \\ \frac{x^2 - 1}{n} \frac{dP_n}{dx} &= xP_n - P_{n-1} \\ (2n+1)P_n &= \frac{d}{dx} (P_{n+1} - P_{n-1}) \end{aligned}$$

证明 (1): 令 $v(x) = (x^2 - 1)^n$ 。恒等式 $(x^2 - 1)v' = 2nxv$ 两边求 $n + 1$ 阶导数, 利用 Leibniz 公式得

$$(x^2 - 1)v^{(n+2)} + 2xv^{(n+1)} - n(n+1)v^{(n)} = 0.$$

除以 $2^n n!$ 并使用 Rodrigues 公式, 即得

$$(1 - x^2)P_n'' - 2xP_n' + n(n+1)P_n = 0.$$

□

12.3 习题 收敛性定理的证明

1. 把函数 $f(x) = \operatorname{sgn} x (-\pi < x < \pi)$ 展开为 Fourier 级数; 并证明:

当 $0 < x < \pi$ 时, 有 $\sum_{k=1}^{\infty} \frac{\sin(2k-1)x}{2k-1} = \frac{\pi}{4}$, 并求级数 $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1}$.

解:

$f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = -f(-x)$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0, a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^{\pi} \sin nx dx = \frac{2(1 - (-1)^n)}{n\pi}$$

$$f(x) \sim F(x)|_{[-\pi, \pi]} = \sum_{n=1}^{\infty} \frac{2}{n\pi} (1 - (-1)^n) \sin nx = \begin{cases} f(x), & x \neq 0, \pm\pi, \\ 0, & x = 0, \pm\pi \end{cases}$$

$$f(x) = \sum_{n=1}^{\infty} \frac{4 \sin(2n-1)x}{(2n-1)\pi} = 1, \quad x \in (0, \pi) \quad \sum_{n=1}^{\infty} \frac{\sin(2n-1)x}{(2n-1)} = \frac{\pi}{4}, \quad x = \frac{\pi}{2} \text{ 时 } \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1} = \frac{\pi}{4}$$

2. 在区间 $(-\pi, \pi)$ 上把下列函数展开为 Fourier 级数:

(1) $|x|$; (2) $\sin ax (a \notin \mathbb{Z})$ (3) $x \sin x$.

解:

(1) $f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = f(-x)$

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} |x| dx = \pi, b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} |x| \sin nx dx = 0 \\ a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} |x| \cos nx dx = \frac{2}{\pi} \int_0^{\pi} x \cos nx dx = \frac{2((-1)^n - 1)}{n^2 \pi} \\ f(x) &\sim F(x)|_{(-\pi, \pi)} = \frac{\pi}{2} + \sum_{n=1}^{\infty} \frac{2((-1)^n - 1)}{n^2 \pi} \cos nx = f(x). \end{aligned}$$

(2) $f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = -f(-x)$

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0, a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0 \\ b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^{\pi} \sin ax \sin nx dx = \frac{2n(-1)^n \sin a\pi}{\pi(a^2 - n^2)} \\ f(x) &\sim F(x)|_{(-\pi, \pi)} = \sum_{n=1}^{\infty} \frac{2n(-1)^n \sin a\pi}{\pi(a^2 - n^2)} \sin nx = f(x). \end{aligned}$$

(3) $f(x)$ 以 2π 周期延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = f(-x)$

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 2, b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} x \sin x \sin nx dx = 0 \\ a_1 &= -\frac{1}{2}, \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} x \sin x \cos nx dx = \frac{2(-1)^{n-1}}{n^2 - 1} \quad (n \geq 2), \\ f(x) &\sim F(x)|_{(-\pi, \pi)} = 1 - \frac{1}{2} \cos x + \sum_{n=2}^{\infty} \frac{2(-1)^{n-1}}{n^2 - 1} \cos nx = f(x). \end{aligned}$$

3. 把 $f(x) = x - [x]([x]$ 是不超过 x 的整数) 在 $[0, 1]$ 上展开为 Fourier 级数.

解:

$$\begin{aligned} 2l &= 1, \omega = 2n\pi, a_0 = \frac{1}{l} \int_0^1 x dx = \frac{1}{2}, \\ a_n &= \frac{1}{l} \int_0^1 x \cos \omega x dx = 0, b_n = \frac{1}{l} \int_0^1 x \sin \omega x dx = \frac{-1}{n\pi} \\ f(x) &\sim F(x)|_{[0, 1]} = \frac{1}{2} + \sum_{n=1}^{\infty} -\frac{1}{n\pi} \sin 2n\pi x = \begin{cases} f(x), & x \neq 1 \\ \frac{1}{2}, & x = 1 \end{cases} \end{aligned}$$

4. 利用 $\cos ax$ 在 $[-\pi, \pi]$ 上的 Fourier 展开式, 证明:

$$(1) \cot x = \frac{1}{x} + \sum_{n=1}^{\infty} \frac{2x}{x^2 - n^2\pi^2} (x \neq k\pi, k = 0, \pm 1, \pm 2, \dots)$$

$$(2) \frac{1}{\sin x} = \frac{1}{x} + \sum_{n=1}^{\infty} (-1)^n \frac{2x}{x^2 - n^2\pi^2} (x \neq k\pi, k = 0, \pm 1, \pm 2, \dots)$$

证明:

$$f(x) \text{ 以 } 2\pi \text{ 周期延拓到 } \mathbb{R}, \text{ 记作 } F(x), \quad f(x+2\pi) = f(x) = f(-x)$$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} \cos ax dx = \frac{2}{a\pi} \cdot \sin ax \Big|_0^{\pi} = \frac{2 \sin a\pi}{a\pi}, b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} \cos ax \sin nx dx = 0$$

$$a_n = \frac{2}{\pi} \int_0^{\pi} \cos ax \cos nx dx = \frac{1}{\pi} \int_0^{\pi} [\cos(a+n)x + \cos(a-n)x] dx$$

$$= \frac{1}{\pi} \left(\frac{\sin(a+n)\pi}{a+n} + \frac{\sin(a-n)\pi}{a-n} \right) = \frac{2a \sin a\pi (-1)^n}{\pi(a^2 - n^2)}$$

$$f(x) \sim F(x)|_{[-\pi, \pi]} = \frac{\sin a\pi}{a\pi} + \sum_{n=1}^{\infty} \frac{1}{\pi} \left(\frac{\sin(a+n)\pi}{a+n} + \frac{\sin(a-n)\pi}{a-n} \right) \cos nx = \cos ax, x \in [0, \pi].$$

$$\text{取 } x = \pi, \frac{\sin a\pi}{a\pi} + \sum_{n=1}^{\infty} \frac{1}{\pi} \left(\frac{\sin(a+n)\pi}{a+n} + \frac{\sin(a-n)\pi}{a-n} \right) = \cos a\pi,$$

$$\therefore \cot x = \frac{1}{x} + \sum_{n=1}^{\infty} \frac{2x}{x^2 - n^2\pi^2} (x \neq k\pi, k = 0, \pm 1, \pm 2, \dots)$$

$$\text{取 } x = 0, \frac{\sin a\pi}{a\pi} + \sum_{n=1}^{\infty} \frac{(-1)^n}{\pi} \left(\frac{\sin(a+n)\pi}{a+n} + \frac{\sin(a-n)\pi}{a-n} \right) = 1,$$

$$\therefore \frac{1}{\sin x} = \frac{1}{x} + \sum_{n=1}^{\infty} (-1)^n \frac{2x}{x^2 - n^2\pi^2} (x \neq k\pi, k = 0, \pm 1, \pm 2, \dots)$$

□

5. 证明: 对任意实数 x , 有

$$|\cos x| = \frac{2}{\pi} + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{4n^2 - 1} \cos 2nx$$

$$|\sin x| = \frac{2}{\pi} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1} \cos 2nx$$

证明 $a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} |\cos x| dx = \frac{4}{\pi} \int_0^{\frac{\pi}{2}} \cos x dx = \frac{4}{\pi}, b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} |\cos x| \sin nx dx \equiv 0,$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} |\cos x| \cos nx dx = \frac{2}{\pi} \left(\int_0^{\frac{\pi}{2}} \cos x \cos nx dx - \int_{\frac{\pi}{2}}^{\pi} \cos x \cos nx dx \right)$$

$$= \frac{1}{\pi} \left(\int_0^{\frac{\pi}{2}} (\cos(1+n)x + \cos(1-n)x) dx - \int_{\frac{\pi}{2}}^{\pi} (\cos(1+n)x + \cos(1-n)x) dx \right)$$

$$= \frac{2}{\pi} \cdot \left(\frac{\sin(1+n)\frac{\pi}{2}}{1+n} + \frac{\sin(1-n)\frac{\pi}{2}}{1-n} \right) = \frac{(-1)^{n-1}}{4n^2 - 1}$$

$$\therefore |\cos x| = \frac{2}{\pi} + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{4n^2 - 1} \cos 2nx,$$

$$|\sin x| = \left| \cos\left(\frac{\pi}{2} - x\right) \right| = \frac{2}{\pi} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1} \cos 2nx.$$

□

$|\sin x|$ 图像

6. 对 $x \in (0, 2\pi)$ 以及 $a \neq 0$, 求证:

$$e^{ax} = \frac{e^{2a\pi} - 1}{\pi} \left(\frac{1}{2a} + \sum_{k=1}^{\infty} \frac{a \cos kx - k \sin kx}{k^2 + a^2} \right)$$

证明

$$a_0 = \frac{1}{\pi} \int_0^{2\pi} e^{ax} dx = \frac{1}{\pi} \cdot \frac{1}{a} e^{ax} \Big|_0^{2\pi} = \frac{1}{a\pi} (e^{2a\pi} - 1)$$

$$a_n = \frac{1}{\pi} \int_0^{2\pi} e^{ax} \cos nx dx = \frac{1}{\pi} \cdot \frac{ae^{ax} \cos nx}{a^2 + n^2} \Big|_0^{2\pi} = \frac{(e^{2a\pi} - 1)a}{\pi(a^2 + n^2)}$$

$$b_n = \frac{1}{\pi} \int_0^{2\pi} e^{ax} \sin nx dx = \frac{1}{\pi} \cdot \frac{-ne^{ax} \cos nx}{a^2 + n^2} \Big|_0^{2\pi} = \frac{(1 - e^{2a\pi})n}{\pi(a^2 + n^2)}$$

$$\therefore e^{ax} = \frac{e^{2a\pi} - 1}{\pi} \left(\frac{1}{2a} + \sum_{n=1}^{\infty} \frac{a \cos nx - n \sin nx}{n^2 + a^2} \right)$$

□

7. 对展开式

$$x = 2 \sum_{n=1}^{\infty} (-1)^{n-1} \frac{\sin nx}{n} \quad (-\pi < x < \pi)$$

逐项积分, 求函数 x^2, x^3 和 x^4 在区间 $(-\pi, \pi)$ 上的 Fourier 展开式, 并证明:

$$\sum_{n=1}^{\infty} \frac{1}{n^6} = \frac{\pi^6}{945}, \quad \sum_{n=1}^{\infty} \frac{1}{n^8} = \frac{\pi^8}{9450}$$

证明:

$$x = 2 \sum_{n=1}^{\infty} (-1)^{n-1} \frac{\sin nx}{n} \quad (-\pi < x < \pi)$$

$$\text{积分得 } \frac{1}{2}x^2 = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{2}{n^2} (1 - \cos nx), x^2 \text{ 的 Fourier 常数项为 } \frac{1}{2\pi} \int_{-\pi}^{\pi} x^2 dx = \frac{\pi^2}{3}$$

$$\therefore x^2 = \frac{\pi^2}{3} + 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} \cos nx, x \in (-\pi, \pi)$$

$$x^3 = \pi^2 x + 12 \sum_{n=1}^{\infty} \frac{(-1)^n}{n^3} \sin nx = 2 \sum_{n=1}^{\infty} (-1)^n (6 - \pi^2 n^2) \frac{\sin nx}{n^3}, x \in (-\pi, \pi)$$

(x 用 Fourier 级数替代得到上式)

$$\frac{1}{\pi} \int_{-\pi}^{\pi} x^6 dx = \sum_{n=1}^{\infty} \left(2 \cdot (-1)^n (6 - \pi^2 n^2) \frac{1}{n^3} \right)^2 \quad (\text{Parseval})$$

$$\therefore \frac{2}{7} \pi^6 = \sum_{n=1}^{\infty} \left(\frac{4\pi^4}{n^2} - \frac{48\pi^2}{n^4} + \frac{144}{n^6} \right), \text{ 有 } \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90} \text{ 与 } \sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}, \text{ 得 } \sum_{n=1}^{\infty} \frac{1}{n^6} = \frac{\pi^6}{945}$$

$$x^4 \text{ 的 Fourier 常数项为 } \frac{1}{2\pi} \int_{-\pi}^{\pi} x^4 dx = \frac{\pi^4}{5}$$

$$x^4 = \frac{\pi^4}{5} + \sum_{n=1}^{\infty} (-1)^n \left(\frac{8\pi^2}{n^2} - \frac{48}{n^4} \right) \cos nx,$$

$$\frac{1}{\pi} \int_{-\pi}^{\pi} x^8 dx = \frac{2\pi^8}{25} + \sum_{n=1}^{\infty} \left(\frac{8\pi^2}{n^2} - \frac{48}{n^4} \right)^2,$$

$$\therefore \frac{2\pi^8}{9} = \frac{2\pi^8}{25} + 64\pi^4 \sum_{n=1}^{\infty} \frac{1}{n^4} - 768\pi^2 \sum_{n=1}^{\infty} \frac{1}{n^6} + 2304 \sum_{n=1}^{\infty} \frac{1}{n^8},$$

$$\text{代入前述 } \sum_{n=1}^{\infty} n^{-4} = \frac{\pi^4}{90}, \sum_{n=1}^{\infty} n^{-6} = \frac{\pi^6}{945}, \text{ 得 } \sum_{n=1}^{\infty} \frac{1}{n^8} = \frac{\pi^8}{9450}.$$

□

$$8. \text{ 设 } f(x) = \begin{cases} \frac{\pi-1}{2}x, & 0 \leq x \leq 1, \\ \frac{\pi-x}{2}, & 1 < x \leq \pi \end{cases}$$

证明:

$$f(x) = \sum_{n=1}^{\infty} \frac{\sin n}{n^2} \sin nx \quad (0 \leq x \leq \pi)$$

$f(x)$ 以 2π 奇延拓到 $\mathbb{R}$, 记作 $F(x)$, $f(x+2\pi) = f(x) = -f(-x)$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0, \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^1 \frac{(\pi-1)x}{2} \sin nx dx + \frac{2}{\pi} \int_1^{\pi} \frac{\pi-x}{2} \sin nx dx \\ &= \frac{\pi-1}{\pi} \int_0^1 x \sin nx dx + \int_1^{\pi} \sin nx dx + \frac{1}{\pi} \int_{-\pi}^{\pi} -x \sin nx dx \\ &= \frac{\pi-1}{\pi} \left(\frac{\sin nx}{n^2} - \frac{x \cos nx}{n} \right) \Big|_0^1 + \left(-\frac{\cos nx}{n} \right) \Big|_1^{\pi} + \frac{1}{\pi} \left(\frac{x \cos nx}{n} - \frac{\sin nx}{n^2} \right) \Big|_{-1}^{\pi} \\ &= \frac{\sin n}{n^2} \\ f(x) &\sim \sum_{i=1}^{\infty} \frac{\sin n}{n^2} \sin nx = f(x) \quad (0 \leq x \leq \pi) \end{aligned}$$

□

9. 利用上题的结果, 证明:

$$(1) \sum_{n=1}^{\infty} \frac{\sin n}{n} = \sum_{n=1}^{\infty} \left(\frac{\sin n}{n} \right)^2 = \frac{\pi-1}{2}; \quad (2) \sum_{n=1}^{\infty} \frac{\sin^2 n}{n^4} = \frac{(\pi-1)^2}{6}.$$

证明:

$$\begin{aligned} (1) f'(x) &= \sum_{i=1}^{\infty} \frac{\sin n}{n} \cos nx, \quad x=0, \quad \frac{\sin n}{n} = \frac{\pi-1}{2}, \\ f(x) &= \sum_{i=1}^{\infty} \frac{\sin n}{n^2} \sin nx, \quad x=1, \quad \sum_{n=1}^{\infty} \left(\frac{\sin n}{n} \right)^2 = \frac{\pi-1}{2} \\ (2) \frac{1}{\pi} \int_{-\pi}^{\pi} f(x)^2 dx &= \sum_{n=1}^{\infty} \left(\frac{\sin n}{n^2} \right)^2 \quad (\text{Parseval}) \\ \sum_{n=1}^{\infty} \frac{\sin^2 n}{n^4} &= \frac{(\pi-1)^2}{6} \end{aligned}$$

□

12.4 习题 Fourier 变换

1. 用 Fourier 积分表示下列函数:

$$(1) f(x) = \begin{cases} 0, & x \leq 0 \\ kx, & 0 < x < T \\ 0, & x \geq T \end{cases} \quad (2) f(x) = \begin{cases} \operatorname{sgn} x, & |x| \leq 1 \\ 0, & |x| > 1 \end{cases} \quad (3)$$

$$f(x) = \frac{1}{a^2 + x^2} (a > 0)$$

解:

$$(1) f(x) = \int_0^{+\infty} [a(\lambda) \cos \lambda x + b(\lambda) \sin \lambda x] d\lambda, f(x) \text{ 绝对可积}$$

$$a(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \cos \lambda t dt = \frac{k}{\pi} \int_0^T t \cos \lambda t dt$$

$$= \frac{k}{\pi} \left(\frac{x \sin \lambda x}{\lambda} + \frac{\cos \lambda x}{\lambda^2} \right) \Big|_0^T = \frac{k}{\pi} \left(\frac{\lambda T \sin \lambda T + \cos \lambda T - 1}{\lambda^2} \right)$$

$$b(\lambda) = \frac{k}{\pi} \left(\frac{\sin(\lambda T) - \lambda T \cos(\lambda T)}{\lambda^2} \right)$$

$$f(x) \sim \int_0^{+\infty} \left[\frac{k}{\lambda^2 \pi} (\lambda T \sin \lambda T + \cos \lambda T - 1) \cos \lambda x + \frac{k}{\lambda^2 \pi} (\sin \lambda T - \lambda T \cos \lambda T) \sin \lambda x \right] d\lambda$$

$$= \begin{cases} 0, & x \leq 0 \\ kx, & 0 < x < T \\ \frac{kT}{2}, & x = T, \\ 0, & x > T \end{cases}$$

$$(2) f(x) = \int_0^{+\infty} [a(\lambda) \cos \lambda x + b(\lambda) \sin \lambda x] d\lambda, f(x) \text{ 绝对可积}$$

$$a(\lambda) \equiv 0, \quad b(\lambda) = \frac{2}{\lambda \pi} (1 - \cos \lambda)$$

$$f(x) \sim \int_0^{+\infty} \frac{2}{\lambda \pi} (1 - \cos \lambda) \sin \lambda x d\lambda$$

$$(3) \because \int_{-\infty}^{+\infty} |f(x)| dx = \frac{2}{a} \arctan \frac{x}{a} \Big|_0^{+\infty} = \frac{\pi}{a} \therefore f(x) \text{ 绝对可积}, b(\lambda) \equiv 0,$$

$$a(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{\cos \lambda x}{a^2 + x^2} = \frac{2}{\pi} \left(\frac{\pi}{2a} e^{-a\lambda} \right) = \frac{e^{-a\lambda}}{a} \text{ (13 章中 Laplace 积分)},$$

$$f(x) \sim \int_0^{+\infty} \frac{e^{-a\lambda}}{a} \cos \lambda x d\lambda = \frac{f(x+0) + f(x-0)}{2} = f(x)$$

2. 求下列函数的 Fourier 变换:

$$(1) f(x) = xe^{-a|x|} (a > 0) \quad (2) f(x) = e^{-a|x|} \cos bx (a > 0) \quad (3) f(x) = \begin{cases} \cos x, & |x| \leq \frac{\pi}{2} \\ 0, & |x| > \frac{\pi}{2} \end{cases}$$

解:

(1) $\because f(x)$ 为奇函数

$$\begin{aligned} F_o(\lambda) &= -2i \int_0^{+\infty} f(t) \sin \lambda t dt = -2i \int_0^{+\infty} t e^{-at} \sin \lambda t dt \\ &= -2i \cdot \left. \frac{e^{-ax} (-\lambda (a^2 x + 2a + \lambda^2 x) \cos(\lambda x) - (a^3 x + a^2 + a\lambda^2 x - \lambda^2) \sin(\lambda x))}{(a^2 + \lambda^2)^2} \right|_0^{+\infty} \\ &= -\frac{4a\lambda i}{(a^2 + \lambda^2)^2} \end{aligned}$$

(2) $\because f(x)$ 为偶函数

$$\begin{aligned} F_e(\lambda) &= 2 \int_0^{+\infty} f(t) \cos \lambda t dt = 2 \int_0^{+\infty} e^{-at} \cos bt \cos \lambda t dt \\ &= \int_0^{+\infty} e^{-at} (\cos(b-\lambda)t + \cos(b+\lambda)t) dt \\ &= e^{-at} \left(\frac{(b-\lambda) \sin(b-\lambda)t - a \cos(b-\lambda)t}{a^2 + (b-\lambda)^2} + \frac{(b+\lambda) \sin(b+\lambda)t - a \cos(b+\lambda)t}{a^2 + (b+\lambda)^2} \right) \Big|_0^{+\infty} \\ &= \frac{a}{a^2 + (b-\lambda)^2} + \frac{a}{a^2 + (b+\lambda)^2} \end{aligned}$$

$$\begin{aligned} (3) \quad f(x) \text{ 绝对可积 } F(\lambda) &= \int_{-\infty}^{+\infty} f(t) e^{-i\lambda t} dt \\ &= \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \left(\frac{e^{it} + e^{-it}}{2} \right) e^{-i\lambda t} dt = \left(\frac{e^{i(1-\lambda)t}}{2i(1-\lambda)} - \frac{e^{-i(1+\lambda)t}}{2i(\lambda+1)} \right) \Big|_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \\ &= \frac{2 \cos\left(\frac{\pi\lambda}{2}\right)}{1-\lambda^2} \end{aligned}$$

3. 按指定的要求将函数 $f(x) = e^{-x} (0 \leq x < +\infty)$ 表示成 Fourier 积分.

(1) 用偶性开拓; (2) 用奇性开拓.

解: 3(1)
$$f_1(x) = \begin{cases} e^{-x}, & 0 \leq x < +\infty \\ e^x, & -\infty < x \leq 0 \end{cases}$$

$$a_1(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \cos \lambda t dt = \frac{2}{\pi} \int_0^{+\infty} e^{-x} \cos \lambda t dx$$

$$= \frac{2}{\pi} \left(\frac{\lambda \sin \lambda x - \cos \lambda x}{(\lambda^2 + 1) e^x} \right) \Big|_0^{+\infty} = \frac{2}{\pi(\lambda^2 + 1)}, b_1(\lambda) = 0,$$

$$f_1(x) = \int_0^{+\infty} \frac{2 \cos \lambda x}{\pi(\lambda^2 + 1)} d\lambda$$

(2)
$$f_2(x) = \begin{cases} e^{-x}, & 0 < x < +\infty \\ 0, & x = 0 \\ -e^x, & -\infty < x < 0 \end{cases}$$

$$b_2(\lambda) = \frac{2}{\pi} \int_0^{+\infty} e^{-x} \sin \lambda t dx = \frac{2\lambda}{\pi(\lambda^2 + 1)}, a_2(\lambda) = 0$$

$$f_2(x) = \int_0^{+\infty} \frac{2\lambda \sin \lambda x}{\pi(\lambda^2 + 1)} d\lambda$$

4. 求函数

$$f(x) = \begin{cases} 0, & |x| > 1 \\ 1, & |x| < 1 \end{cases} \text{ 的 Fourier 变换. 由此证明}$$

$$\int_0^{+\infty} \frac{\sin \alpha \cos \alpha x}{\alpha} d\alpha = \begin{cases} \frac{\pi}{2}, & |x| < 1 \\ \frac{\pi}{4}, & |x| = 1 \\ 0, & |x| > 1 \end{cases}$$

证明: $f(x)$ 为偶函数, $b(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \sin \lambda t dt = 0,$

$$a(\lambda) = \frac{1}{\pi} \int_{-\infty}^{+\infty} f(t) \cos \lambda t dt = \frac{2}{\pi} \int_0^1 \cos \lambda t dt = \frac{2 \sin \lambda}{\pi \lambda},$$

$$f(x) = \int_0^{+\infty} \frac{2 \sin \lambda \cos \lambda x}{\lambda \pi} d\lambda = \begin{cases} 1, & |x| < 1, \\ \frac{1}{2}, & |x| = 1, \\ 0, & |x| > 1, \end{cases}$$

$$\therefore \int_0^{+\infty} \frac{\sin u \cos ux}{u} du = \begin{cases} \frac{\pi}{2}, & |x| < 1, \\ \frac{\pi}{4}, & |x| = 1, \\ 0, & |x| > 1. \end{cases}$$

□

5. 求函数 $F(\lambda) = \lambda e^{-\beta|\lambda|} (\beta > 0)$ 的 Fourier 逆变换.

解:

$$\begin{aligned} f(x) &= \frac{1}{2\pi} \int_{-\infty}^{+\infty} F(\lambda) e^{i\lambda x} d\lambda = \frac{i}{\pi} \int_0^{+\infty} \lambda e^{-\beta\lambda} \sin(\lambda x) d\lambda \\ &= -\frac{i}{\pi} \frac{\partial}{\partial x} \int_0^{+\infty} e^{-\beta\lambda} \cos(\lambda x) d\lambda = -\frac{i}{\pi} \frac{\partial}{\partial x} \frac{\beta}{\beta^2 + x^2} = \frac{2i\beta x}{\pi (\beta^2 + x^2)^2}. \end{aligned}$$

12.5 第 12 章综合习题

1. 证明: 级数 $\sum_{n=2}^{\infty} \frac{\sin nx}{\ln n}$ 在不包含 2π 整数倍的闭区间上一致收敛, 但它不是任意在 $[-\pi, \pi]$ 上平方可积函数的 Fourier 级数

证明 设 $[a, b] \subset (0, 2\pi)$. 则当 $x \in [a, b]$ 时, 有

$$\left| \sum_{k=1}^n \sin(kx) \right| = \left| \frac{\cos \frac{x}{2} - \cos \frac{(2n+1)x}{2}}{2 \sin \frac{x}{2}} \right| \leq \frac{1}{\sin \frac{x}{2}}$$

加之 $\frac{1}{\ln n}$ 单减趋零, 由 Dirichlet 判别法, 级数 $\sum_{n=2}^{\infty} \frac{\sin nx}{\ln n}$ 在 $[a, b]$ 一致收敛,

又级数以 2π 为周期, 故级数在不包含 2π 整数倍的闭区间上一致收敛

第二小问采取反证法, 若该级数在 $[-\pi, \pi]$ 上平方可积, 则由 Bessel 不等式

$$\sum_{n=2}^{\infty} \frac{1}{\ln^2 n} < +\infty, \text{ 这与它是发散级数矛盾.}$$

□

2. 证明下列等式:

$$(1) \sum_{n=1}^{\infty} (-1)^{n-1} \frac{\cos nx}{n} = \ln \left(2 \cos \frac{x}{2} \right) \quad (-\pi < x < \pi)$$

$$(2) \sum_{n=1}^{\infty} \frac{\cos nx}{n} = -\ln \left(2 \sin \frac{x}{2} \right) \quad (0 < x < 2\pi)$$

证明 令 $f(x) = \ln \left(2 \cos \frac{x}{2} \right)$, $(-\pi < x < \pi)$. 则 $f(x)$ 是连续可导的偶函数.

$$\therefore b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = 0$$

$$a_0 = \frac{2}{\pi} \int_0^{\pi} \ln \left(2 \cos \frac{x}{2} \right) dx = 2 \ln 2 + \frac{2}{\pi} \int_0^{\pi} \ln \left(\cos \frac{x}{2} \right) dx$$

由于 $\int_0^{\frac{\pi}{2}} \ln(\sin x) dx = -\frac{\pi}{2} \ln 2$, 并作代换 $u = x/2$, 可知 $a_0 = 0$.

对于 $n = 1, 2, \dots$, 应用分部积分及变换 $x = \pi - t$, 我们有

$$\begin{aligned} a_n &= \frac{2}{\pi} \int_0^\pi \ln \left(2 \cos \frac{x}{2} \right) \cos nx \, dx \\ &= \frac{2}{\pi} \ln \left(2 \cos \frac{x}{2} \right) \frac{\sin nx}{n} \Big|_0^\pi + \frac{1}{n\pi} \int_0^\pi \frac{\sin nx \sin \frac{x}{2}}{\cos \frac{x}{2}} \, dx \\ &= \frac{(-1)^{n-1}}{n\pi} \int_0^\pi \frac{\sin nx \cos \frac{x}{2}}{\sin \frac{x}{2}} \, dx \\ &\text{又 } \because \sin nx \cos \frac{x}{2} = \frac{1}{2} \sin \left(n + \frac{1}{2} \right) x + \frac{1}{2} \sin \left(n - \frac{1}{2} \right) x \\ \frac{\sin \left(n + \frac{1}{2} \right) x}{2 \sin \frac{x}{2}} &= \frac{1}{2} + \sum_{k=1}^n \cos kx, \quad \frac{\sin \left(n - \frac{1}{2} \right) x}{2 \sin \frac{x}{2}} = \frac{1}{2} + \sum_{k=1}^{n-1} \cos kx \end{aligned}$$

$\therefore a_n = \frac{(-1)^{n-1}}{n}, n = 1, 2, \dots$. 由 Dirichlet 收敛定理知 (1) 成立. 类似地, 可证明 (2).

只需要设 $f(x) = \ln \left(2 \sin \frac{x}{2} \right) \quad (0 < x < 2\pi)$ 得到 $a_n = \frac{(-1)^n}{n}, n = 1, 2, \dots$ □

3. 设 f 是周期为 2π 的可积且绝对可积函数. 证明:

(1) 如果 f 在 $(0, 2\pi)$ 上递减, 那么 $b_n \geq 0$;

(2) 如果 f 在 $(0, 2\pi)$ 上递增, 那么 $b_n \leq 0$.

证明 只需证明 f 在 $(0, 2\pi)$ 上递减的情况. 因为无界递减函数可用有界递减函数逼近, 所以可以只对 $f(x)$ 是有界的函数证明. 根据第二积分中值定理, 对于 $[s, t] \subset (0, 2\pi)$, 存在 $\xi \in [s, t]$ 使得

$$\begin{aligned} \int_s^t f(x) \sin nx \, dx &= f(s) \int_s^\xi \sin nx \, dx + f(t) \int_\xi^t \sin nx \, dx \\ &= f(s) \frac{\cos ns - \cos n\xi}{n} + f(t) \frac{\cos n\xi - \cos nt}{n} \\ &= \frac{1 - \cos n\xi}{n} (f(s) - f(t)) + f(s) \frac{\cos ns - 1}{n} + f(t) \frac{1 - \cos nt}{n} \\ &\geq f(s) \frac{\cos ns - 1}{n} + f(t) \frac{1 - \cos nt}{n} \end{aligned}$$

令 $s \rightarrow 0, t \rightarrow 2\pi$, 得 $2b_n \geq 0$. 所以 $b_n \geq 0$. □

4. 设 f 是周期为 2π 且在 $[-\pi, \pi]$ 上 Riemann 可积的函数. 如果它在 $(-\pi, \pi)$ 上单调, 证明:

$$a_n = O\left(\frac{1}{n}\right), b_n = O\left(\frac{1}{n}\right) (n \rightarrow \infty).$$

证明 根据第二积分中值定理, 存在 $\xi \in [-\pi, \pi]$ 使得

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx \, dx \\ &= \frac{1}{\pi} \left(f(-\pi) \int_{-\pi}^{\xi} \cos nx \, dx + f(\pi) \int_{\xi}^{\pi} \cos nx \, dx \right) \\ &= \frac{1}{\pi} \left(f(-\pi) \frac{\sin n\xi}{n} - f(\pi) \frac{\sin n\xi}{n} \right) = O\left(\frac{1}{n}\right) \end{aligned}$$

同理, 可证 $b_n = O\left(\frac{1}{n}\right)$.

★ 补充两个定理

(Riemann-Lebesgue 引理) 设函数 $f(x)$ 在 $[a, b]$ 上 Riemann 可积, 则有

$$\begin{aligned} \lim_{\lambda \rightarrow +\infty} \int_a^b f(x) \cos(\lambda x) dx &= 0 \\ \lim_{\lambda \rightarrow +\infty} \int_a^b f(x) \sin(\lambda x) dx &= 0 \end{aligned}$$

(广义 Riemann-Lebesgue 引理) 设函数 $f(x)$ 在 $[a, b]$ 上 Riemann 可积, 函数 $g(x)$ 以正数 T 为周期, 且在 $[0, T]$ 上可积, 则有

$$\lim_{n \rightarrow +\infty} \int_a^b f(x) g(nx) dx = \frac{1}{T} \int_0^T g(x) dx \int_a^b f(x) dx$$

证明 情形 1: $g(x) \geq 0$ 时, 取自然数 m 使得 $[a, b] \subset [-mT, mT]$, 令

$$F(x) = \begin{cases} f(x), & x \in [a, b] \\ 0, & x \in [-mT, mT] \setminus [a, b] \end{cases}$$

则有

$$\begin{aligned} \int_a^b f(x) g(nx) dx &= \int_{-mT}^{mT} F(x) g(nx) dx \\ \int_a^b f(x) dx &= \int_{-mT}^{mT} F(x) dx \end{aligned}$$

考虑分割 $-mT, -mT + \frac{T}{n}, -mT + \frac{2T}{n}, \dots, -mT + \frac{2mnT}{n}$, 我们有

$$\int_a^b f(x) g(nx) dx = \sum_{k=0}^{2mn-1} \int_{-mT + \frac{kT}{n}}^{-mT + \frac{(k+1)T}{n}} F(x) g(nx) dx$$

由于 $g(nx) \geq 0$, 根据第一积分中值定理, 存在

$$x_k \in \left[-mT + \frac{kT}{n}, -mT + \frac{k+1}{n}T \right]$$

使得

$$\begin{aligned}\int_a^b f(x)g(nx)dx &= \sum_{k=0}^{2mn-1} F(x_k) \int_{-mT+\frac{kT}{n}}^{-mT+\frac{(k+1)T}{n}} g(nx)dx = \sum_{k=0}^{2mn-1} F(x_k) \frac{1}{n} \int_0^T g(x-mnT+kT)dx \\ &= \sum_{k=0}^{2mn-1} F(x_k) \frac{1}{n} \int_0^T g(x)dx = \frac{1}{T} \int_0^T g(x)dx \sum_{k=0}^{2mn-1} F(x_k) \cdot \frac{T}{n}\end{aligned}$$

因为 $\sum_{k=0}^{2mn-1} F(x_k) \cdot \frac{T}{n}$ 介于函数 $F(x)$ 在区间 $[-mT, mT]$ 上关于前述分割的 Darboux 上和与 Darboux 下和之间, 所以

$$\lim_{n \rightarrow +\infty} \sum_{k=0}^{2mn-1} F(x_k) \cdot \frac{T}{n} = \int_{-mT}^{mT} F(x)dx = \int_a^b f(x)dx$$

于是

$$\lim_{n \rightarrow +\infty} \int_a^b f(x)g(nx)dx = \frac{1}{T} \int_0^T g(x)dx \int_a^b f(x)dx$$

情形 2: 对一般的 $g(x)$, 利用

$$g(x) = \frac{|g(x)| + g(x)}{2} - \frac{|g(x)| - g(x)}{2}$$

$$\text{有 } \int_a^b f(x)g(nx)dx = \int_a^b f(x) \frac{|g(nx)| + g(nx)}{2} dx - \int_a^b f(x) \frac{|g(nx)| - g(nx)}{2} dx$$

根据情形 1 的结论, 得

$$\begin{aligned}& \lim_{n \rightarrow +\infty} \int_a^b f(x)g(nx)dx \\ &= \frac{1}{T} \int_0^T \frac{|g(x)| + g(x)}{2} dx \int_a^b f(x)dx - \frac{1}{T} \int_0^T \frac{|g(x)| - g(x)}{2} dx \int_a^b f(x)dx \\ &= \frac{1}{T} \int_0^T g(x)dx \int_a^b f(x)dx\end{aligned}$$

至此证明了广义 Riemann-Lebesgue 定理 □

5. 设 f 在 $[-a, a]$ 上连续, 且在 $x=0$ 处可导. 求证:

$$\lim_{\lambda \rightarrow +\infty} \int_{-a}^a \frac{1 - \cos \lambda x}{x} f(x)dx = \int_0^a \frac{f(x) - f(-x)}{x} dx.$$

证明 作变换 $x = -t$, 有

$$\int_{-a}^0 \frac{1 - \cos \lambda x}{x} f(x)dx = \int_a^0 \frac{1 - \cos \lambda t}{t} f(-t)dt.$$

$$\therefore \int_{-a}^a \frac{1 - \cos \lambda x}{x} f(x)dx = \int_0^a \frac{f(x) - f(-x)}{x} dx - \int_0^a F(x) \cos \lambda x dx$$

其中 $F(x) = \begin{cases} \frac{f(x) - f(-x)}{x}, & x \neq 0 \\ 2f'(0), & x = 0. \end{cases}$ 由于 $f(x)$ 在 $[-a, a]$ 上连续, 且在 $x = 0$ 处可导,

可知 $F(x)$ 在 $[-a, a]$ 连续. 根据 Riemann-Lebesgue 引理,

上式右端第二个积分当 $\lambda \rightarrow +\infty$ 时趋于零. 故结论得证 $\square$

6. 设 f 在 $[a, b]$ 上 Riemann 可积. 证明:

$$\lim_{\lambda \rightarrow +\infty} \int_a^b f(x) |\cos \lambda x| dx = \frac{2}{\pi} \int_a^b f(x) dx,$$

$$\lim_{\lambda \rightarrow +\infty} \int_a^b f(x) |\sin \lambda x| dx = \frac{2}{\pi} \int_a^b f(x) dx.$$

证明 根据习题 12.3 的结论, 对 $x \in \mathbb{R}$, 有

$$|\cos x| = \frac{2}{\pi} + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{4n^2 - 1} \cos 2nx$$

$$|\sin x| = \frac{2}{\pi} - \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1} \cos 2nx$$

因此

$$f(x) |\cos \lambda x| = \frac{2}{\pi} f(x) + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{4n^2 - 1} f(x) \cos 2n\lambda x$$

由于 $f(x)$ 在 $[a, b]$ 可积, 可知 $f(x)$ 有界, 因而上式右端的级数关于 x 在 $[a, b]$ 上一致 con.

$$\therefore \text{考虑积分 } \int_a^b f(x) |\cos \lambda x| dx = \frac{2}{\pi} \int_a^b f(x) dx + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{4n^2 - 1} \int_a^b f(x) \cos 2n\lambda x dx$$

此式右端的级数关于 λ 一致 con. 再由 Riemann-Lebesgue 引理, 可得

$$\lim_{\lambda \rightarrow +\infty} \int_a^b f(x) |\cos \lambda x| dx = \frac{2}{\pi} \int_a^b f(x) dx$$

同理可得 $\lim_{\lambda \rightarrow +\infty} \int_a^b f(x) |\sin \lambda x| dx = \frac{2}{\pi} \int_a^b f(x) dx$

7. 设 f 是周期为 2π 的连续函数. 令

$$F(x) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) f(x+t) dt$$

用 a_n, b_n 和 A_n, B_n 分别表示 f 和 F 的 Fourier 系数. 证明:

$$A_0 = a_0^2, A_n = a_n^2 + b_n^2, B_n = 0.$$

由此推出 f 的 Parseval 等式.

证明: 因为 f 是周期为 2π 的连续函数, 所以 f 是有界函数, 即, 存在 $M > 0$ 使得 $|f(x)| < M$ 对 $x \in \mathbb{R}$ 成立. $f(x)$ 也是在 $\mathbb{R}$ 上一致连续函数. 因此对任意正数 ε 存在 $\delta > 0$ 使得当 $|x_1 - x_2| < \delta$ 时, 有

$$|f(x_1) - f(x_2)| \leq \frac{\varepsilon}{2M}.$$

因此, 对给定 x_0 当 $|x - x_0| < \delta$ 时, 有

$$\begin{aligned} |F(x) - F(x_0)| &= \frac{1}{\pi} \left| \int_{-\pi}^{\pi} f(t) [f(x+t) - f(x_0+t)] dt \right| \\ &\leq \frac{1}{\pi} \int_{-\pi}^{\pi} |f(t) [f(x+t) - f(x_0+t)]| dt \\ &\leq \frac{1}{\pi} \int_{-\pi}^{\pi} M \cdot \frac{\varepsilon}{2M} dt = \varepsilon \end{aligned}$$

这说明 $F(x)$ 在 x_0 连续. $F(x)$ 是以 2π 为周期的函数是显然的. 故 $F(x)$ 是以 2π 为周期的连续函数. 也容易证明当 $f(x)$ 可导时, $F(x)$ 也可导.

$$F(-x) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) f(-x+t) dt = \frac{1}{\pi} \int_{-x-\pi}^{-x+\pi} f(x+u) f(u) du$$

(作变换 $t = x + u$)

$$\begin{aligned} &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x+u) f(u) du \\ &= F(x) \end{aligned}$$

(利用 f 的周期性)

故 $F(x)$ 是以 2π 为周期的函数. 因此 $B_n = 0$. 对于 $n = 0, 1, 2, \dots$,

$$\begin{aligned} A_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} F(x) \cos nx \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} \left(\frac{1}{\pi} \int_{-\pi}^{\pi} f(t) f(x+t) dt \right) \cos nx \, dx \\ &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \left(\frac{1}{\pi} \int_{-\pi}^{\pi} f(x+t) \cos nx \, dx \right) dt \\ &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \left(\frac{1}{\pi} \int_{-\pi+t}^{\pi+t} f(u) \cos n(u-t) du \right) dt \\ &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) \left(\frac{1}{\pi} \int_{-\pi+t}^{\pi+t} f(u) (\cos nu \cos nt + \sin nu \sin nt) du \right) dt \\ &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(t) (a_n \cos nt + b_n \sin nt) dt = \begin{cases} a_n^2 + b_n^2, & n \geq 1 \\ a_0^2, & n = 0 \end{cases} \end{aligned}$$

当 $f(x)$ 分段可导时, $F(x)$ 也分段可导, 由 Dirichlet 收敛定理, 有

$$F(x) = \frac{A_0}{2} + \sum_{n=1}^{\infty} A_n \cos nx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \cos nx$$

$$\text{在上式中令 } x = 0 \text{ 得 } \frac{1}{\pi} \int_{-\pi}^{\pi} f^2(t) dt = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2)$$

即 Parseval 等式成立.(这里只对 $f(x)$ 是分段可导的连续函数情况证明, 一般的情况要用 Fourier 级数均值求和的 Fejér 定理. $\square$)

8. 设 f 在 $[-\pi, \pi]$ 上连续, 且在此区间上有可积且平方可积的导数 f' .

如果 f 满足 $f(-\pi) = f(\pi)$, $\int_{-\pi}^{\pi} f(x) dx = 0$

证明: $\int_{-\pi}^{\pi} (f'(x))^2 dx \geq \int_{-\pi}^{\pi} f^2(x) dx$ 等号当且仅当 $f(x) = \alpha \cos x + \beta \sin x$ 时成立.

证明 将 f 和 f' 以 2π 为周期延拓到 $\mathbb{R}$. 设函数 $f(x)$ 的 Fourier 系数为 a_n, b_n , 设函数 $f'(x)$ 的 Fourier 系数为 a'_n, b'_n .

$$\because f(-\pi) = f(\pi), \int_{-\pi}^{\pi} f(x) dx = 0 \quad a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0$$

$$a'_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) dx = \frac{1}{\pi} (f(\pi) - f(-\pi)) = 0$$

$$\begin{aligned} a'_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \cos nx \, dx \\ &= \frac{1}{\pi} f(x) \cos nx \Big|_{-\pi}^{\pi} + \frac{n}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = nb_n \end{aligned}$$

$$\begin{aligned} b'_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f'(x) \sin nx \, dx \\ &= \frac{1}{\pi} f(x) \sin nx \Big|_{-\pi}^{\pi} - \frac{n}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx \, dx = -na_n \end{aligned}$$

注意到 $f(x)$ 与 $f'(x)$ 都是可积且平方可积的, 根据 Parseval 等式, 有

$$\begin{aligned} \frac{1}{\pi} \int_{-\pi}^{\pi} f^2(x) dx &= \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \\ \frac{1}{\pi} \int_{-\pi}^{\pi} (f'(x))^2 dx &= \sum_{n=1}^{\infty} ((a'_n)^2 + (b'_n)^2) = \sum_{n=1}^{\infty} n^2 (a_n^2 + b_n^2) \\ &\therefore \int_{-\pi}^{\pi} (f'(x))^2 dx \geq \int_{-\pi}^{\pi} f^2(x) dx. \end{aligned}$$

且上式成为等号当且仅当 $a_n = b_n = 0 (n \geq 2)$, 即 $f(x) = \frac{a_0}{2} + a_1 \cos x + b_1 \sin x = \alpha \cos x + \beta \sin x$

□

13 反常积分和含参积分

13.1 习题 反常积分

1. 判断下列反常积分的收敛性:

$$(1) \int_0^{+\infty} \frac{\ln(x^2+1)}{x} dx \quad (2) \int_0^{+\infty} \sqrt{x}e^{-x} dx; \quad (3) \int_0^{+\infty} \frac{x \arctan x}{\sqrt[3]{1+x^4}} dx \quad (4) \int_{e^2}^{+\infty} \frac{dx}{x \ln \ln x}; \quad (5) \int_0^1 \frac{\ln x}{\sqrt{1-x^2}} dx; \quad (6) \int_0^1 \frac{x^2}{\sqrt[3]{(1-x^2)^5}} dx \quad (7) \int_0^1 \frac{dx}{e^{\sqrt{x}}-1}; \quad (8) \int_0^1 \frac{\sqrt{x}}{e^{\sin x}-1} dx; \quad (9) \int_0^1 \frac{dx}{e^x - \cos x} \quad (10) \int_0^{\frac{\pi}{2}} \frac{\ln \sin x}{\sqrt{x}} dx \quad (11) \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{\sin x \cos x}}; \quad (12) \int_0^{+\infty} \frac{\arctan x}{x^\mu} dx$$

解: (1)

$$\int_0^{+\infty} \frac{\ln(x^2+1)}{x} dx = \int_0^1 \frac{\ln(x^2+1)}{x} dx + \int_1^{+\infty} \frac{\ln(x^2+1)}{x} dx,$$

$$\lim_{x \rightarrow 0} \frac{\ln(x^2+1)}{x} = 0 \text{ (L'Hospital)}, \therefore \int_0^1 \frac{\ln(x^2+1)}{x} dx \text{ Riemann 可积,}$$

$$\therefore \frac{\ln(x^2+1)}{x} > \frac{1}{x} > 0, \quad x > 2$$

$$\int_0^{+\infty} \frac{1}{x} dx \text{ div, 积分 } \int_1^{+\infty} \frac{\ln(x^2+1)}{x} dx \text{ div, 比较判别法则 div.}$$

(2)

$$\therefore \lim_{x \rightarrow +\infty} \frac{x^2}{e^x} = 0, \therefore x \rightarrow +\infty, x^2 < e^x$$

$$\therefore \frac{\sqrt{x}}{e^x} < \frac{\sqrt{x}}{x^2} = \frac{1}{x^{\frac{3}{2}}}$$

$$\int_1^{+\infty} \frac{1}{x^{\frac{3}{2}}} dx \text{ con, 比较法极限形式 } \int_0^{+\infty} \sqrt{x}e^{-x} dx \text{ con}$$

(3) $x=0$ 不是瑕点,

$$\lim_{x \rightarrow +\infty} \frac{x \arctan x}{\sqrt[3]{1+x^4}} \bigg/ \frac{1}{x^{\frac{1}{3}}} = \frac{\pi}{2}$$

$$\therefore \int_0^{+\infty} \frac{1}{x^{\frac{1}{3}}} dx \text{ div, 比较法极限形式 } \therefore \int_0^{+\infty} \frac{x \arctan x}{\sqrt[3]{1+x^4}} dx \text{ div}$$

(4)

$$\int_{e^2}^{+\infty} \frac{dx}{x \ln \ln x} = \int_{e^2}^{+\infty} \frac{d \ln x}{\ln \ln x} = \int_2^{+\infty} \frac{dt}{\ln t}$$

$$\therefore \frac{\frac{1}{\ln t}}{\frac{1}{t}} = \frac{t}{\ln t} \rightarrow +\infty, \quad t \rightarrow +\infty,$$

$$\int_2^{+\infty} \frac{1}{t} dt \text{ div, 比较判别法, div.}$$

(5)

$$\lim_{x \rightarrow 1} \frac{\ln x}{\sqrt{1-x^2}} = \lim_{x \rightarrow 1} \frac{\frac{1}{x}}{\frac{-2x}{2\sqrt{1-x^2}}} = \lim_{x \rightarrow 1} \frac{-\sqrt{1-x^2}}{x^2} = 0 \text{ (L'Hospital),}$$

$\therefore x=1$ 不是瑕点,

$$\int_0^1 \frac{\ln x}{\sqrt{1-x^2}} dx = \int_{+\infty}^1 \frac{-\ln t}{\sqrt{1-\frac{1}{t^2}}} \cdot \left(-\frac{1}{t^2}\right) dt = -\int_1^{+\infty} \frac{\ln t}{t\sqrt{t^2-1}} dt$$

$$\therefore \lim_{t \rightarrow +\infty} \frac{\frac{\ln t}{t\sqrt{t^2-1}}}{\frac{1}{t^{\frac{3}{2}}}} = \lim_{t \rightarrow +\infty} \frac{\ln t}{\sqrt{t}} = 0$$

$\int_1^{+\infty} \frac{1}{t^{\frac{3}{2}}} dt$ con, 比较判别法, $\int_1^{+\infty} \frac{\ln t}{t\sqrt{t^2-1}} dt$ con, 原式 con.

(6) 当 $x \rightarrow 1^-$ 时, $\frac{x^2}{(1-x^2)^{5/3}} \sim \frac{1}{2^{5/3}(1-x)^{5/3}}$, 故积分发散。

(7) 当 $x \rightarrow 0^+$ 时, $\frac{1}{e^{\sqrt{x}}-1} \sim x^{-1/2}$; 因 $\int_0^1 x^{-1/2} dx$ 收敛, 原积分收敛。

(8) 当 $x \rightarrow 0^+$ 时, $\frac{\sqrt{x}}{e^{\sin x}-1} \sim x^{-1/2}$, 故原积分收敛。

(9) 当 $x \rightarrow 0^+$ 时, $e^x - \cos x \sim x$, 所以 $\frac{1}{e^x - \cos x} \sim \frac{1}{x}$, 原积分发散。

(10) 当 $x \rightarrow 0^+$ 时 $\ln(\sin x) \sim \ln x$, 且 $\int_0^1 |\ln x| x^{-1/2} dx < \infty$, 故原积分绝对收敛。

(11) 当 $x \rightarrow (\pi/2)^-$ 时, $\sqrt{\sin x} \rightarrow 1$ 且 $\cos x \sim \pi/2 - x$, 所以被积函数等价于 $(\pi/2 - x)^{-1}$, 原积分发散到 $+\infty$ 。

(12)

$$I(\mu) = \int_0^{+\infty} \frac{\arctan x}{x^\mu} dx = \int_0^1 \frac{\arctan x}{x^\mu} dx + \int_1^{+\infty} \frac{\arctan x}{x^\mu} dx$$

由于

$$\lim_{x \rightarrow 0^+} x^{\mu-1} \cdot \frac{\arctan x}{x^\mu} = \lim_{x \rightarrow 0^+} \frac{\arctan x}{x} = 1$$

因此当 $\mu < 2$ 时, $\int_0^1 \frac{\arctan x}{x^\mu} dx$ 收敛; 而当 $\mu \geq 2$ 时发散. 又

$$\lim_{x \rightarrow +\infty} x^\mu \cdot \frac{\arctan x}{x^\mu} = \frac{\pi}{2}$$

故当 $\mu > 1$ 时, $\int_1^{+\infty} \frac{\arctan x}{x^\mu} dx$ con; 而当 $\mu \leq 1$ 时, div. $\therefore$ 当且仅当 $1 < \mu < 2$ 时, $I(\mu)$ con.

2. 研究下列积分的条件收敛性与绝对收敛性:

(1) $\int_1^{+\infty} \frac{\cos(1-2x)}{\sqrt[3]{x}\sqrt[3]{x^2+1}} dx$ (2) $\int_0^{+\infty} \frac{\sin x}{\sqrt[3]{x^2+x+1}} dx$; (3) $\int_2^{+\infty} \frac{\sin x}{x \ln x} dx$; (4) $\int_0^{+\infty} \frac{\ln(1+x)}{x^2(1+x^p)} dx$ ($p > 0$); (5) $\int_0^{+\infty} \frac{\sin x}{x(1+\sqrt{x})} dx$; (6) $\int_0^1 \frac{\sin \frac{1}{x}}{x^p} dx$.

解:(1)

$$\frac{|\cos(1-2x)|}{\sqrt[3]{x}\sqrt[3]{x^2+1}} \sim \frac{|\cos(1-2x)|}{x}, \quad x \rightarrow +\infty$$

加之

$$\begin{aligned}\int_1^{+\infty} \frac{|\cos(1-2x)|}{x} dx &\geq \int_1^{+\infty} \frac{\cos^2(1-2x)}{x} dx \\ &= \int_1^{+\infty} \frac{1+\cos(2-4x)}{2x} dx \\ &= \frac{1}{2} \int_1^{+\infty} \frac{1}{x} dx + \int_1^{+\infty} \frac{\cos(2-4x)}{2x} dx\end{aligned}$$

$\int_1^{+\infty} \frac{1}{x} dx$ 发散,

$$\left| \int_1^a \cos(2-4x) dx \right| = \left| \frac{1}{4} \sin(4x-2) \right|_1^a \leq \frac{1}{2}, \quad \forall a > 1$$

有界且 $\frac{1}{x}$ 单调递减趋 0, Dirichlet 判别法, $\int_1^{+\infty} \frac{\cos(2-4x)}{2x} dx$ con, 从而积分 $\int_1^{+\infty} \frac{|\cos(1-2x)|}{x} dx$ div, 比较判别法, $\int_1^{+\infty} \frac{|\cos(1-2x)|}{\sqrt[3]{x}\sqrt[3]{x^2+1}} dx$ 发散. 只一方面,

$$\frac{\cos(1-2x)}{\sqrt[3]{x}\sqrt[3]{x^2+1}} \sim \frac{\cos(1-2x)}{x}, \quad x \rightarrow +\infty$$

由 $\int_1^a \cos(1-2x) dx (a > 1)$ 有界且 $\frac{1}{x}$ 单调递减趋于 0 及 Dirichlet 判别法知, $\int_1^{+\infty} \frac{\cos(1-2x)}{x} dx$ 收敛, 由比较判别法知, $\int_1^{+\infty} \frac{\cos(1-2x)}{\sqrt[3]{x}\sqrt[3]{x^2+1}} dx$ 收敛. 综上, 原积分条件收敛.

(2) $\int_0^{\infty} \sin x dx = 0$ 加上 $\frac{1}{\sqrt[3]{x^2+x+1}}$ 单减趋零, Dirichlet 判别法, 条件 con

(3) 一方面:

$$\int_2^{+\infty} \frac{|\sin x|}{x \ln x} dx \geq \int_2^{+\infty} \frac{\sin^2 x}{x \ln x} dx = \int_2^{+\infty} \frac{1}{2x \ln x} dx - \int_2^{+\infty} \frac{\cos 2x}{2x \ln x} dx,$$

$\int_2^{+\infty} \frac{1}{2x \ln x} dx = \frac{1}{2} \ln \ln x \Big|_2^{+\infty}$ 发散, 又 $\int_2^a \cos 2x dx (a > 2)$ 有界且 $\frac{1}{2x \ln x}$ 单调递减趋于 0, 由 Dirichlet 判别法知, $\int_2^{+\infty} \frac{\cos 2x}{2x \ln x} dx$ 收敛, 从而 $\int_2^{+\infty} \frac{\sin^2 x}{x \ln x} dx$ 发散, 由比较判别法知, $\int_2^{+\infty} \frac{|\sin x|}{x \ln x} dx$ 发散.

另一方面, $\int_2^a \sin x dx (a > 2)$ 有界且 $\frac{1}{x \ln x}$ 单调递减趋于 0, 由 Dirichlet 判别法, $\int_2^{+\infty} \frac{\sin x}{x \ln x} dx$ con. $\therefore$ 原积分条件 con.

(4)

$$\int_0^{+\infty} \frac{\ln(1+x)}{x^2(1+x^p)} dx = \int_0^1 \frac{\ln(1+x)}{x^2(1+x^p)} dx + \int_1^{+\infty} \frac{\ln(1+x)}{x^2(1+x^p)} dx,$$

注意到

$$0 < \frac{\ln(1+x)}{x^2(1+x^p)} < \frac{\ln(1+x)}{x^2} < \frac{1}{x^{\frac{3}{2}}}, \quad x \rightarrow +\infty$$

由比较判别法知, $\int_1^{+\infty} \frac{\ln(1+x)}{x^2(1+x^p)} dx$ 收敛; 又

$$\frac{\ln(1+x)}{x^2(1+x^p)} \sim \frac{x}{x^2(1+x^p)} \sim \frac{1}{x}, \quad x \rightarrow 0$$

由 $\int_0^1 \frac{1}{x} dx$ 发散及比较判别法知, $\int_0^1 \frac{\ln(1+x)}{x^2(1+x^p)} dx$ 发散, 从而原积分发散.

(5) 在 0 附近被积函数有界, 而在无穷远处 $\left| \frac{\sin x}{x(1+\sqrt{x})} \right| \leq x^{-3/2}$, 故绝对收敛.

(6) $\int_0^1 \frac{\sin \frac{1}{x}}{x^p} dx = \int_1^{+\infty} \frac{\sin t}{t^{2-p}} dt$.

$p < 1$ 时绝对收敛; $1 \leq p < 2$ 时条件收敛; $p \geq 2$ 时发散.

3. 设 $f(x)$ 在 $[a, +\infty)$ 单调、连续, $\int_a^{+\infty} f(x) dx$ 收敛, 求证: $\lim_{x \rightarrow +\infty} f(x) = 0$.

证明 不妨设 $f(x)$ 单调递减. 先证: $\lim_{x \rightarrow +\infty} f(x) = b$ 存在.

证明: 只需证 $f(x)$ 在 $[a, +\infty)$ 上有界. 用反证法. 假设 $f(x)$ 在 $[a, +\infty)$ 上无界, 则 $\exists X > a$, 使得当 $x > X$ 时, 有 $f(x) < -1$, 从而 $\int_X^{+\infty} f(x) dx < \int_X^{+\infty} (-1) dx$, 原积分发散, 与题设矛盾. 故 $f(x)$ 有界. 又 $f(x)$ 单调, 从而 $\lim_{x \rightarrow +\infty} f(x) = b$ 存在.

下证: $b = 0$. 用反证法. 假设 $b \neq 0$, 不妨 $b > 0$, 从而对 $\varepsilon = \frac{b}{2}$, $\exists X' > a$, 使得当 $x > X'$ 时, 有

$$|f(x) - b| < \frac{b}{2} \iff \frac{b}{2} < f(x) < \frac{3}{2}b,$$

从而

$$\int_{X'}^{+\infty} f(x) dx > \int_{X'}^{+\infty} \frac{b}{2} dx \rightarrow +\infty$$

故原积分发散, 与题设矛盾. 因此 $\lim_{x \rightarrow +\infty} f(x) = b = 0$. □

4. 设 $f(x)$ 和 $g(x)$ 在 $[0, +\infty)$ 上非负, $\int_0^{+\infty} g(x) dx$ 收敛, 且当 $0 < x < y$ 时, 有

$$f(y) \leq f(x) + \int_x^y g(t) dt$$

求证: $\lim_{x \rightarrow +\infty} f(x)$ 存在.

证明先证: $f(x)$ 在 $[0, +\infty)$ 上有界. 取 $x = 1$, 对 $\forall y > x = 1$, 有

$$0 \leq f(y) \leq f(1) + \int_1^y g(t) dt \leq f(1) + \int_1^{+\infty} g(t) dt$$

由 $\int_0^{+\infty} g(t) dt$ 收敛, $f(x)$ 在 $[1, +\infty)$ 上有界, 在 $[0, 1]$ 上有界, 故 $f(x)$ 在 $[0, +\infty)$ 上有界.

再证: $\lim_{x \rightarrow +\infty} f(x)$ 存在. 由 $f(x)$ 有界及 Bolzano-Weierstrass 定理知, 存在数列 $\{a_n\}$ 满足 $a_n \rightarrow +\infty (n \rightarrow \infty)$ 且 $\{f(a_n)\}$ 收敛. 记 $\lim_{n \rightarrow \infty} f(a_n) = l (\geq 0)$. 对 $\forall \varepsilon > 0$, $\exists N_1 \in \mathbb{N}^*$, 使得当 $n > N_1$ 时, 有

$$|f(a_n) - l| < \frac{\varepsilon}{2},$$

由 $\int_0^{+\infty} g(t) dt$ 收敛及 Cauchy 收敛准则知, $\exists X > 0$, 使得当 $x, y > X$ 时, 有

$$\left| \int_x^y g(t) dt \right| = \int_x^y g(t) dt < \frac{\varepsilon}{2},$$

又 $a_n \rightarrow +\infty (n \rightarrow \infty)$, 从而 $\exists N_2 \in \mathbb{N}^*$, 使得当 $n > N_2$ 时, 有 $a_n > X$. 取 $N = \max\{N_1, N_2\}$, 当 $x > a_{N+1} (> X)$ 时, $\exists n_1, n_2 > N$, 满足 $a_{n_1} \leq x \leq a_{n_2}$, 从而

$$\begin{cases} f(x) \leq f(a_{n_1}) + \int_{a_{n_1}}^x g(t)dt < l + \frac{\varepsilon}{2} + \frac{\varepsilon}{2}, \\ l - \frac{\varepsilon}{2} < f(a_{n_2}) \leq f(x) + \int_x^{a_{n_2}} g(t)dt < f(x) + \frac{\varepsilon}{2} \end{cases} \implies |f(x) - l| < \varepsilon,$$

这就证明了 $\lim_{x \rightarrow +\infty} f(x) = l$ 存在 □

5. 设 $f(x)$ 和 $g(x)$ 在 $[0, +\infty)$ 上非负, $g(x)$ 单调递减趋于 0, 且 $\int_0^{+\infty} f(x)g(x)dx$. 求证: $\lim_{x \rightarrow +\infty} g(x) \int_0^x f(t)dt = 0$

证明 由 $\int_0^{+\infty} f(x)g(x)dx$ 收敛及 Cauchy 收敛准则知, 对 $\forall \varepsilon > 0, \exists X_1 > 0$, 使得当 $x > A > X_1$ 时, 有

$$\int_A^x f(t)g(t)dt < \frac{\varepsilon}{2},$$

又 $g(x)$ 单调递减, 从而

$$g(x) \int_A^x f(t)dt \leq \int_A^x f(t)g(t)dt < \frac{\varepsilon}{2},$$

由 $g(x) \rightarrow 0 (x \rightarrow +\infty)$ 知, $\exists X_2 > A$, 使得当 $x > X_2$ 时, 有

$$g(x) < \frac{\frac{\varepsilon}{2}}{\int_0^A f(t)dt} \implies g(x) \int_0^A f(t)dt < \frac{\varepsilon}{2},$$

从而当 $x > X_2$ 时, 有

$$g(x) \int_0^x f(t)dt = g(x) \left(\int_0^A f(t)dt + \int_A^x f(t)dt \right) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon.$$

□

6. 设 $\int_0^{+\infty} f(x)dx$ 绝对收敛, g 在每个有界区间上有界, 且 $\lim_{x \rightarrow +\infty} g(x) = 0$. 求证: $\lim_{x \rightarrow +\infty} \int_0^x f(t)g(x-t)dt = 0$.

证明 由 $\lim_{x \rightarrow +\infty} g(x) = 0$ 知, $g(x)$ 有界, 即 $\exists M > 0$, 使得 $|g(x)| \leq M$ 对 $\forall x \in [0, +\infty)$ 成立. 对 $\forall \varepsilon > 0$, 由 $\int_0^{+\infty} |f(t)|dt = l$ 收敛及 Cauchy 收敛准则知, $\exists X_1 > 0$, 使得当 $y > X_1$ 时, 有

$$\int_y^{+\infty} |f(t)|dt < \frac{\varepsilon}{2M},$$

对上述取定的 y , 由 $\lim_{x \rightarrow +\infty} g(x) = 0$ 知, $\exists X_2 > y$, 使得当 $x > X_2$ 时, 有

$$|g(x-y)| < \frac{\varepsilon}{2l},$$

从而

$$\begin{aligned}\left|\int_0^x f(t)g(x-t)dt\right| &= \left|\int_0^y f(t)g(x-t)dt + \int_y^x f(t)g(x-t)dt\right| \\ &\leq \int_0^y |f(t)||g(x-t)|dt + \int_y^x |f(t)||g(x-t)|dt \\ &< \frac{\varepsilon}{2l} \int_0^y |f(t)|dt + M \int_y^x |f(t)|dt \\ &< \frac{\varepsilon}{2l} \cdot l + M \cdot \frac{\varepsilon}{2M} = \varepsilon\end{aligned}$$

□

13.2 习题 反常多重积分

1. 计算反常积分:

(1) $\iint_D \frac{1}{\sqrt{x^2+y^2}} dx dy$, 其中 D 是单位圆内部;

(2) $\iint_D \frac{dx dy}{(1+x+y)^\alpha}$, 其中 D 是第一象限, $\alpha > 2$ 为常数;

(3) $\iint_D \max(x, y) e^{-(x^2+y^2)} dx dy$, 其中 D 是第一象限.

解:

$$I_1 = \int_0^{2\pi} d\theta \int_0^1 \frac{1}{r} r dr = 2\pi$$

$$\begin{aligned} I_2 &= \int_0^{+\infty} \left(\frac{1}{(1-\alpha)(1+x+y)^{\alpha-1}} \right) \Big|_0^{+\infty} dy = \int_0^{+\infty} \frac{1}{(1-\alpha)(1+y)^{\alpha-1}} dy \\ &= \frac{1}{\alpha-1} \left(\frac{1}{(2-\alpha)(1+y)^{\alpha-1}} \right) \Big|_0^{+\infty} = \frac{1}{(\alpha-1)(\alpha-2)} \end{aligned}$$

$$\begin{aligned} I_3 &= \int_0^{\pi/2} \int_0^{+\infty} r \max(\cos \theta, \sin \theta) e^{-r^2} r dr d\theta \\ &= \left(2 \int_0^{\pi/4} \cos \theta d\theta \right) \left(\int_0^{+\infty} r^2 e^{-r^2} dr \right) = \sqrt{2} \cdot \frac{\sqrt{\pi}}{4} = \sqrt{\frac{\pi}{8}}. \end{aligned}$$

2. 借用 Fresnel 积分 $\int_{-\infty}^{+\infty} \sin x^2 dx = \int_{-\infty}^{+\infty} \cos x^2 dx = \sqrt{\frac{\pi}{2}}$ 验证下列累次积分

$$\int_{-\infty}^{+\infty} dy \int_{-\infty}^{+\infty} \sin(x^2 + y^2) dx = \int_{-\infty}^{+\infty} dx \int_{-\infty}^{+\infty} \sin(x^2 + y^2) dy = \pi$$

并证明函数 $\sin(x^2 + y^2)$ 在定义 13.14 意义下在 $\mathbb{R}^2$ 上的反常二重积分发散.(提示:分别考虑 $\mathbb{R}^2$ 的两个竭尽递增列 $D_n = \{(x, y) | |x| \leq n, |y| \leq n\}$ 和 $B_n = \{(x, y) | x^2 + y^2 \leq 2n\pi\}$).

证明:

$$\begin{aligned} &\int_{-\infty}^{+\infty} dy \int_{-\infty}^{+\infty} \sin(x^2 + y^2) dx \\ &= \int_{-\infty}^{+\infty} dy \int_{-\infty}^{+\infty} (\sin x^2 dx \cos y^2 + \cos x^2 dx \sin y^2) \\ &= \sqrt{\frac{\pi}{2}} \int_{-\infty}^{+\infty} (\cos y^2 + \sin y^2) dy = \sqrt{\frac{\pi}{2}} \sqrt{2\pi} = \pi \end{aligned}$$

对圆盘竭尽列 B_n , 极坐标给出

$$\iint_{B_n} \sin(x^2 + y^2) dx dy = 2\pi \int_0^{\sqrt{2n\pi}} r \sin(r^2) dr = \pi(1 - \cos(2n\pi)) = 0.$$

对正方形竭尽列 $D_n = [-n, n]^2$, 则

$$\iint_{D_n} \sin(x^2 + y^2) dx dy = 2 \left(\int_{-n}^n \sin x^2 dx \right) \left(\int_{-n}^n \cos x^2 dx \right) \longrightarrow \pi.$$

两个竭尽列所得极限不同, 故定义 13.14 意义下的反常二重积分发散。

□

13.3 习题 含参变量的积分

1. 试用两种方法计算以下极限: (1) $\lim_{\alpha \rightarrow 0} \int_{-1}^1 \sqrt{x^2 + \alpha^2} dx$

$$(2) \lim_{\alpha \rightarrow 0} \int_{\alpha}^{1+\alpha} \frac{1}{1+x^2+\alpha^2} dx$$

解:

(1)

$$\begin{aligned} \text{方法 (i)} \quad \int_{-1}^1 \sqrt{x^2 + \alpha^2} dx &= \frac{\alpha^2}{2} \ln \frac{2 + \alpha^2 + 2\sqrt{1 + \alpha^2}}{\alpha} + \sqrt{1 + \alpha^2} \\ \lim_{\alpha \rightarrow 0} \int_{-1}^1 \sqrt{x^2 + \alpha^2} dx &= \lim_{\alpha \rightarrow 0} \left(\frac{\alpha^2}{2} \ln \frac{2 + \alpha^2 + 2\sqrt{1 + \alpha^2}}{\alpha^2} + \sqrt{1 + \alpha^2} \right) \\ &= 1 - \lim_{\alpha \rightarrow 0} \frac{\alpha^2}{2} \ln \alpha^2 = 1 - \frac{1}{2} \lim_{\alpha \rightarrow 0} \frac{\ln \alpha^2}{\frac{1}{\alpha^2}} = 1 \\ \text{方法 (ii)} \quad \text{由连续性} \quad \lim_{\alpha \rightarrow 0} \int_{-1}^1 \sqrt{x^2 + \alpha^2} dx &= \int_{-1}^1 \lim_{\alpha \rightarrow 0} \sqrt{x^2 + \alpha^2} dx \\ &= \int_{-1}^1 |x| dx = 2 \int_0^1 x dx = 1 \end{aligned}$$

(2)

$$\begin{aligned} \text{方法 (i)} \quad \int_{\alpha}^{1+\alpha} \frac{1}{1+x^2+\alpha^2} dx &= \left(\frac{\arctan \frac{x}{\sqrt{\alpha^2+1}}}{\sqrt{\alpha^2+1}} \right) \Big|_{\alpha}^{1+\alpha} \\ &= \frac{1}{\sqrt{\alpha^2+1}} \left(\arctan \frac{1+\alpha}{\sqrt{\alpha^2+1}} - \arctan \frac{\alpha}{\sqrt{1+\alpha^2}} \right) \\ \lim_{\alpha \rightarrow 0} \left(\int_{\alpha}^{1+\alpha} \frac{1}{1+x^2+\alpha^2} dx \right) &= \frac{1}{1} (\arctan 1 - \arctan 0) = \frac{\pi}{4} \\ \text{方法 (ii)} \quad \text{由连续性} \quad \int_{\alpha}^{1+\alpha} \lim_{\alpha \rightarrow 0} \frac{dx}{1+x^2+\alpha^2} &= \int_{\alpha}^{1+\alpha} \frac{dx}{1+x^2} \\ &= \arctan x \Big|_{\alpha}^{1+\alpha} = \arctan(1+\alpha) - \arctan \alpha = \frac{\pi}{4}. \end{aligned}$$

2. 求 $F'(\alpha)$

$$\begin{aligned} (1) \quad F(\alpha) &= \int_{\sin \alpha}^{\cos \alpha} e^{\alpha \sqrt{1-x^2}} dx \\ (2) \quad F(\alpha) &= \int_{a+\alpha}^{b+\alpha} \frac{\sin \alpha x}{x} dx \\ (3) \quad F(\alpha) &= \int_0^{\alpha} \frac{\ln(1+\alpha x)}{x} dx \\ (4) \quad F(\alpha) &= \int_0^{\alpha} f(x+\alpha, x-\alpha) dx (f(u, v) \text{ 有连续偏导数}). \end{aligned}$$

解:

$$2. (1) F(\alpha) = \int_{\sin \alpha}^{\cos \alpha} e^{\alpha \sqrt{1-x^2}} dx$$

$$F'(\alpha) = -\sin \alpha e^{\alpha |\sin \alpha|} - \cos \alpha e^{\alpha |\cos \alpha|} + \int_{\sin \alpha}^{\cos \alpha} \sqrt{1-x^2} e^{\alpha \sqrt{1-x^2}} dx$$

$$(2) F'(\alpha) = \int_{a+\alpha}^{b+\alpha} \frac{\sin \alpha x}{x} dx =$$

$$\begin{aligned} F'(\alpha) &= \frac{\sin(\alpha(b+\alpha))}{b+\alpha} - \frac{\sin(\alpha(a+\alpha))}{a+\alpha} + \int_{a+\alpha}^{b+\alpha} \cos(\alpha x) dx \\ &= \frac{\sin(\alpha b + \alpha^2)}{b+\alpha} - \frac{\sin(\alpha a + \alpha^2)}{a+\alpha} + \frac{\sin(\alpha b + \alpha^2) - \sin(\alpha a + \alpha^2)}{\alpha} \end{aligned}$$

$$(3) F(\alpha) = \int_0^\alpha \frac{\ln(1+\alpha x)}{x} dx$$

$$F'(\alpha) = \frac{\ln(1+\alpha^2)}{\alpha} + \int_0^\alpha \frac{x}{x(1+\alpha x)} dx = \frac{2 \ln(1+\alpha^2)}{\alpha}$$

$$(4) F(\alpha) = \int_0^\alpha f(x+\alpha, x-\alpha) dx, \quad f(u, v) = g(x, \alpha), \quad u = x+\alpha, v = x-\alpha$$

$$F'(\alpha) = \left(\int_0^\alpha g(x, \alpha) dx \right)'_\alpha = g(\alpha, \alpha) + \int_0^\alpha \frac{\partial g(x, \alpha)}{\partial \alpha} dx$$

$$= f(2\alpha, 0) + \int_0^\alpha \left(\frac{\partial f(u, v)}{\partial u} - \frac{\partial f(u, v)}{\partial v} \right) dx$$

$$\text{方法二: } \because \frac{\partial f(u, v)}{\partial v} = \frac{\partial f(x+\alpha, x-\alpha)}{\partial x} - \frac{\partial f(u, v)}{\partial u}$$

$$F'(\alpha) = f(2\alpha, 0) + \int_0^\alpha \left(\frac{2\partial f(u, v)}{\partial u} - \frac{\partial f(x+\alpha, x-\alpha)}{\partial x} \right) dx$$

$$= f(2\alpha, 0) + 2 \int_0^\alpha \frac{\partial f(u, v)}{\partial u} dx - \int_0^\alpha \frac{\partial f(x+\alpha, x-\alpha)}{\partial x} dx$$

$$= f(2\alpha, 0) + 2 \int_0^\alpha \frac{\partial f(u, v)}{\partial u} dx - f(x+\alpha, x-\alpha)|_0^\alpha$$

$$= f(2\alpha, 0) + 2 \int_0^\alpha \frac{\partial f(u, v)}{\partial u} dx - f(2\alpha, 0) + f(\alpha, -\alpha)$$

$$= 2 \int_0^\alpha \frac{\partial f(u, v)}{\partial u} dx + f(\alpha, -\alpha).$$

3. 设 $f(x)$ 在 $[a, b]$ 上连续, 证明

$$y(x) = \frac{1}{k} \int_c^x f(t) \sin k(x-t) dt, \quad c, x \in [a, b]$$

满足常微分方程

$$y'' + k^2 y = f(x)$$

其中 c 与 k 为常数.

证明:

$$\begin{aligned}y'(x) &= \frac{1}{k}f(x)\sin k(x-x) + \frac{k}{k}\int_c^x f(t)\cos k(x-t)dt \\&= \int_c^x f(t)\cos k(x-t)dt, \\y''(x) &= f(x)\cos k(x-x) + k\int_c^x f(t)(-\sin k(x-t))dt \\&= f(x) - k\int_c^x f(t)\sin k(x-t)dt \\\therefore y'' + k^2y &= f(x) - k\int_c^x f(t)\sin k(x-t)dt + k\int_c^x f(t)\sin k(x-t)dt = f(x)\end{aligned}$$

□

4. 应用对参数进行微分或积分的方法, 计算下列积分:

(1) $\int_0^{\frac{\pi}{2}} \ln(a^2 \sin^2 x + b^2 \cos^2 x) dx$ ($a > 0, b > 0$); (2) $\int_0^{\pi} \ln(1 - 2a \cos x + a^2) dx$ ($0 \leq a < 1$); (3) $\int_0^{\frac{\pi}{2}} \frac{\arctan(a \tan x)}{\tan x} dx$ ($a \geq 0$); (4) $\int_0^{\frac{\pi}{2}} \ln \frac{1+a \cos x}{1-a \cos x} \cdot \frac{dx}{\cos x}$ ($0 \leq a < 1$).

解:

$$\begin{aligned}
 & (1) \int_0^{\frac{\pi}{2}} \ln(a^2 \sin^2 x + b^2 \cos^2 x) dx \\
 &= \int_0^{\frac{\pi}{2}} \ln\left(\sin^2 x + \frac{b^2}{a^2} \cos^2 x\right) dx + \int_0^{\frac{\pi}{2}} \ln a^2 dx \\
 D: 0 \leq x \leq \frac{\pi}{2}, \quad 0 \leq u = \frac{b}{a} \leq 1, f(x, u) &= \ln\left(\sin^2 x + \frac{b^2}{a^2} \cos^2 x\right) \\
 F'(u) &= \int_0^{\frac{\pi}{2}} \frac{\partial f(x, u)}{\partial u} dx = \int_0^{\frac{\pi}{2}} \frac{2u \cos^2 x}{\sin^2 x + u^2 \cos^2 x} dx \\
 &= 2u \int_0^{\frac{\pi}{2}} \frac{dx}{\tan^2 x + u^2} = 2u \int_0^{+\infty} \frac{dv}{(1+v^2)(u^2+v^2)} \\
 &= \frac{2u}{1-u^2} \int_0^{+\infty} \left(\frac{1}{u^2+v^2} - \frac{1}{1+v^2}\right) dv \\
 &= \frac{2u}{1-u^2} \left(\frac{1}{u} \arctan \frac{v}{u} \Big|_0^{+\infty} - \frac{\pi}{2}\right) = \frac{\pi}{1+u} \\
 F(1) &= 0, \quad C_0 = -\pi \ln 2 \\
 F(u) &= \pi \ln(1+u) - \pi \ln 2 = \pi \ln \frac{u+1}{2} \\
 I &= \frac{\pi}{2} \ln a^2 + \pi \ln \frac{u+1}{2} = \pi \ln \frac{|a|+|b|}{2}
 \end{aligned}$$

$$(2) I(a) = \int_0^{\pi} \ln(1 - 2a \cos x + a^2) dx, \quad 1 - 2a \cos x + a^2 \geq 1 - 2a + a^2 > 0$$

$$f(x, a) = \ln(1 - 2a \cos x + a^2), \quad D: 0 < x < \pi, 0 \leq a < 1$$

$$\begin{aligned}
 I'(a) &= \int_0^{\pi} \frac{\partial f(x, a)}{\partial a} dx = \int_0^{\pi} \frac{2a - 2 \cos x}{1 - 2a \cos x + a^2} dx \\
 &= \frac{\pi}{a} + \frac{1}{a} \int_0^{\pi} \frac{a^2 - 1}{1 - 2a \cos x + a^2} dx = \frac{\pi}{a} - \frac{2}{a} \arctan \left(\frac{1+a}{1-a} \tan \frac{x}{2} \right) \Big|_0^{\pi} = 0
 \end{aligned}$$

$$I(a) \triangleq C_0, \quad I(0) = 0, \quad \therefore I(a) = 0$$

$$\begin{aligned}
(3) \quad I(a) &= \int_0^{\frac{\pi}{2}} \frac{\arctan(a \tan x)}{\tan x} dx, \\
f(x, a) &= \frac{\arctan(a \tan x)}{\tan x}, \quad D: 0 < x < \frac{\pi}{2}, \quad a \geq 0, \\
I'(a) &= \int_0^{\frac{\pi}{2}} \frac{\partial f(x, a)}{\partial a} dx = \int_0^{\frac{\pi}{2}} \frac{1}{(a \tan x)^2 + 1} dx \\
&= \left(\frac{a \arctan(a \tan x) - \arctan(\tan x)}{a^2 - 1} \right) \Big|_0^{\frac{\pi}{2}} = \frac{\pi}{2(a+1)} \\
I(0) &= 0, \quad c_0 \triangleq 0, \quad I(a) = \frac{\pi}{2} \ln(a+1)
\end{aligned}$$

$$\begin{aligned}
(4) \quad I(a) &= \int_0^{\frac{\pi}{2}} \ln \frac{1+a \cos x}{1-a \cos x} \frac{dx}{\cos x}, \\
f(x, a) &= \frac{1}{\cos x} \ln \frac{1+a \cos x}{1-a \cos x}, \quad D: 0 \leq a < 1, 0 < x < \frac{\pi}{2} \\
I'(a) &= \int_0^{\frac{\pi}{2}} \frac{\partial f(x, a)}{\partial a} dx = \int_0^{\frac{\pi}{2}} \left(\frac{1}{1+a \cos x} + \frac{1}{1-a \cos x} \right) dx \\
&= \int_0^{\frac{\pi}{2}} \frac{2}{1-a^2 \cos^2 x} dx \stackrel{\text{令 } t=\tan x}{=} \int_0^{+\infty} \frac{2 dt}{(1-a^2) + t^2} \\
&= \frac{2}{\sqrt{1-a^2}} \arctan \left(\frac{1}{\sqrt{1-a^2}} \tan x \right) \Big|_0^{+\infty} = \frac{\pi}{\sqrt{1-a^2}} \\
I(0) &= 0, \quad I(a) = \pi \arcsin a
\end{aligned}$$

另一种方法：积分 $\int \frac{dx}{1-x^2} = \frac{1}{2} \ln \frac{1+x}{1-x} + C$.

$$\begin{aligned}
\therefore \frac{1}{\cos x} \ln \frac{1+a \cos x}{1-a \cos x} &= 2a \int_0^1 \frac{dy}{1-(a^2 \cos^2 x) y^2} \quad \left(0 \leq x < \frac{\pi}{2}, |a| < 1 \right) \\
\int_0^{\frac{\pi}{2}} \frac{1}{\cos x} \ln \frac{1+a \cos x}{1-a \cos x} dx &= 2a \int_0^{\frac{\pi}{2}} dx \int_0^1 \frac{dy}{1-(a^2 \cos^2 x) y^2} \\
&= 2a \int_0^1 dy \int_0^{\frac{\pi}{2}} \frac{dx}{1-(a^2 \cos^2 x) y^2} \stackrel{\text{令 } t=\tan x}{=} \pi \arcsin ay \Big|_0^1 = \pi \arcsin a
\end{aligned}$$

13.4 习题 含参变量的反常积分

1. 确定下列参变量反常积分的收敛域: (1) $\int_0^{+\infty} x^u dx$; (2) $\int_1^{+\infty} x^u \frac{x+\sin x}{x-\sin x} dx$; (3) $\int_2^{+\infty} \frac{dx}{x \ln^u x}$; (4) $\int_0^\pi \frac{dx}{\sin^u x}$; (5) $\int_0^{+\infty} \frac{\sin^2 x}{x^\alpha(1+x)} dx$; (6) $\int_0^{+\infty} \frac{\ln(1+x^2)}{x^\alpha} dx$.

解: (1) $\emptyset$

$$\begin{cases} \int_0^{+\infty} x^u dx \text{ div}, & u \geq 0 \\ \int_0^{+\infty} x^u dx = \frac{x^{u+1}}{u+1} \Big|_0^{+\infty} \text{ div}, & -1 < u < 0 \\ \int_0^{+\infty} x^{+\infty} dx = \int_0^1 \frac{1}{x} dx + \int_1^{+\infty} \frac{1}{x} dx \text{ div}, & u = -1 \\ \int_0^{+\infty} x^u dx \text{ div} & u < -1 \end{cases}$$

(2) $u < -1$

$\because \lim_{x \rightarrow +\infty} \frac{x + \sin x}{x - \sin x} = 1$, 故由极限比较判别法, 原积分与 $\int_1^{+\infty} x^u dx$ 同敛散。

(3) $u > 1$

$$\begin{cases} \int_2^{+\infty} \frac{dx}{x \ln x} = \ln(\ln x) \Big|_2^{+\infty} = +\infty, \text{ div}, & u = 1 \\ \int_2^{+\infty} \frac{dx}{x(\ln x)^u} = \frac{1}{1-u} (\ln x)^{1-u} \Big|_2^{+\infty} \text{ div}, & u < 1 \\ \int_2^{+\infty} \frac{dx}{x(\ln x)^u} = \frac{1}{(u-1)(\ln 2)^{u-1}} \text{ con}, & u > 1 \end{cases}$$

(4) $u < 1$

$$\begin{cases} \int_0^\pi \csc^u x dx \text{ div}, & u \geq 1 \\ \text{con}, & u < 1 \end{cases}$$

(5) (0, 3)

$$I(\alpha) = \int_0^1 \frac{\sin^2 x}{x^\alpha(1+x)} dx + \int_1^{+\infty} \frac{\sin^2 x}{x^\alpha(1+x)} dx = I_1(\alpha) + I_2(\alpha).$$

$$x \rightarrow 0^+: \frac{\sin^2 x}{x^\alpha(1+x)} \sim x^{2-\alpha}, \quad I_1 \text{ 收敛当且仅当 } \alpha < 3;$$

$$x \rightarrow +\infty: \frac{\sin^2 x}{x^\alpha(1+x)} \asymp \frac{\sin^2 x}{x^{\alpha+1}}, \quad I_2 \text{ 收敛当且仅当 } \alpha > 0.$$

$$\therefore \alpha \in (0, 3).$$

(6)(1, 3)

$$\begin{aligned}
 I(\alpha) &= \int_0^1 \frac{\ln(1+x^2)}{x^2} dx + \int_1^{+\infty} \frac{\ln(1+x^2)}{x^\alpha} dx \\
 &\because \lim_{x \rightarrow 0^+} \frac{\ln(1+x^2)}{x^\alpha} = \lim_{x \rightarrow 0^+} \frac{\ln(1+x^2)}{x^2} \cdot \frac{1}{x^{\alpha-2}} \\
 &\alpha - 2 < 1, I_1(\alpha) \text{ con.} \\
 &\alpha > 1, I_2(\alpha) \text{ con,} \quad \therefore \alpha \in (1, 3)
 \end{aligned}$$

2. 研究下列积分在指定区间上的一致收敛性: (1) $\int_{-\infty}^{+\infty} \frac{\cos ux}{1+x^2} dx$ ($-\infty < u < +\infty$); (2) $\int_0^{+\infty} e^{-\alpha x} \sin \beta x dx$, a) $0 < \alpha_0 \leq \alpha < +\infty$; b) $0 < \alpha < +\infty$. (3) $\int_0^{+\infty} \sqrt{\alpha} e^{-\alpha x^2} dx$ ($0 \leq \alpha < +\infty$) (4) $\int_1^{+\infty} \frac{\ln(1+x^2)}{x^\alpha} dx$ ($1 < \alpha < +\infty$) (5) $\int_1^{+\infty} e^{-\alpha x} \frac{\cos x}{x^p} dx$ ($0 \leq \alpha < +\infty$) (其中 $p > 0$ 的常数) (6) $\int_0^{+\infty} \frac{\sin(x^2)}{1+x^p} dx$ ($0 \leq p < +\infty$)

解:

(1) Weierstrass 判别法 (优积分判别法): 一致 con

$$\begin{cases} \int_0^{+\infty} \frac{1}{1+x^2} dx = \arctan x|_0^{+\infty} = \frac{\pi}{2}, \text{con} \\ \left| \frac{\cos ux}{1+x^2} \right| \leq \frac{1}{1+x^2}, \quad \therefore \int_0^{+\infty} \frac{\cos ux}{1+x^2} dx < \frac{\pi}{2} \end{cases}$$

(2) 解 先说明在 $\alpha_0 \leq \alpha < +\infty$ 上一致收敛。由于当 $\alpha \geq \alpha_0$ 时,

$$|e^{-\alpha x} \sin \beta x| \leq e^{-\alpha x} \leq e^{-\alpha_0 x}$$

而 $\int_0^{+\infty} e^{-\alpha_0 x} dx$ 收敛, 故由优积分判别法知 $\int_0^{+\infty} e^{-\alpha x} \sin \beta x$ 在 $0 < \alpha_0 \leq \alpha < +\infty$ 上一致收敛。再说明在 $0 < \alpha < +\infty$ 上不收敛。取 $\epsilon_0 = \frac{1}{\beta e}, \forall A > 0, \exists k_0 > \frac{A\beta}{2k}, \alpha_0 = \frac{\beta}{(2k_0+1)\pi} \in (0, +\infty)$ 使得

$$\left| \int_{\frac{2k_0\pi}{\beta}}^{\frac{(2k_0+1)\pi}{\beta}} e^{-\alpha_0 x} \sin \beta x dx \right| \geq e^{-\frac{(2k_0+1)\pi/\beta}{(2k_0+1)\pi/\beta}} \int_{\frac{2k_0\pi}{\beta}}^{\frac{(2k_0+1)\pi}{\beta}} \sin \beta x dx = \frac{2}{e\beta} > \epsilon_0$$

故原式非一致收敛。(上述默认 $\beta \neq 0$ 。 $\beta = 0$ 时显然一致收敛)

(3) 不一致 con

$$\begin{aligned}
 I(\alpha) &= \int_0^{+\infty} \sqrt{\alpha} e^{-\alpha x^2} dx \\
 I(0) &= 0, \quad \lim_{\alpha \rightarrow 0^+} I(\alpha) = \frac{\sqrt{\pi}}{2} \neq 0, \quad I(\alpha) \text{ 不连续}
 \end{aligned}$$

(4) 不一致收敛。若在 $\alpha \in (1, +\infty)$ 上一致收敛, 则由第 3 题的结论, 令 $\alpha \rightarrow 1^+$ 后边界积分 $\int_1^{+\infty} \ln(1+x^2)x^{-1} dx$ 也应收敛; 但该积分发散, 矛盾。(5) 一致收敛。函数 $e^{-\alpha x} x^{-p}$ 对 x 单调递减, 且 $0 \leq e^{-\alpha A} A^{-p} \leq A^{-p} \rightarrow 0$ (关于 $\alpha \geq 0$ 一致); 再结合 $\int_A^B \cos x dx$ 的一致有界性, 由一致 Dirichlet 判别法即得结论。(6) 一致收敛。分部积分可得 $\sup_{B>A} \left| \int_A^B \sin(x^2) dx \right| \leq C/A$ 。而 $(1+x^p)^{-1}$ 对 x 单调递减且不超过 1, 故 Abel-Dirichlet 估计给出尾积分关于 $p \geq 0$ 一致地为 $O(A^{-1})$ 。

3. 设 $f(x, u)$ 在 $a \leq x < +\infty, \alpha \leq u \leq \beta$ 上连续, 又对于 $[\alpha, \beta]$ 上每一 u , 积分 $\int_a^{+\infty} f(x, u) dx$ 收敛, 而当 $u = \beta$ 时 $\int_a^{+\infty} f(x, \beta) dx$ 发散, 试证积分 $\int_a^{+\infty} f(x, u) dx$ 在 $[\alpha, \beta]$ 上必不一致收敛.

证明 用反证法.

假设其在 $[\alpha, \beta]$ 上一致收敛, 从而对 $\forall \varepsilon > 0, \exists X > a$, 使得当 $A_1, A_2 > X$ 时, 有

$$\left| \int_{A_1}^{A_2} f(x, u) dx \right| < \frac{\varepsilon}{2}, \quad \forall u \in [\alpha, \beta],$$

令 $u \rightarrow \beta^-$, 又由 $f(x, u)$ 在 $u \in [\alpha, \beta]$ 上连续知,

$$\left| \int_{A_1}^{A_2} f(x, \beta) dx \right| \leq \frac{\varepsilon}{2} < \varepsilon,$$

这与 $\int_a^{+\infty} f(x, \beta) dx$ 发散矛盾. 因此积分 $\int_a^{+\infty} f(x, u) dx$ 在 $[\alpha, \beta]$ 上必不一致收敛. $\square$

4. 证明: $\varphi(u) = \int_a^{+\infty} u e^{-ux} dx$ 是 $u > 0$ 上的连续函数, 虽然该积分在 $u \geq 0$ 上不一致收敛.

证明 积分 $\varphi(u) = \int_a^{+\infty} u e^{-ux} dx$ 在 $u \geq 0$ 收敛. 因为

$$\left| \int_A^{+\infty} u e^{-ux} dx \right| = \begin{cases} 0, & u = 0 \\ e^{-uA}, & u > 0 \end{cases}$$

$u > 0$ 时可直接算得 $\varphi(u) = e^{-au}$, 故 φ 在 $(0, +\infty)$ 连续 (也可在任意紧区间 $[\delta, M] \subset (0, +\infty)$ 上用一致收敛证明).

$\therefore \beta(A) = \sup_{u \geq 0} \left| \int_A^{+\infty} u e^{-ux} dx \right| = 1$, 故不一致收敛 ($u \geq 0$). $\square$

5. 验证 $\int_0^1 du \int_0^{+\infty} (2 - xu) x u e^{-xu} dx \neq \int_0^{+\infty} dx \int_0^1 (2 - xu) x u e^{-xu} du$ 并说明理由.

证明

$$\begin{aligned} \text{左边} &= \int_0^1 du \cdot \frac{1}{u} \int_0^{+\infty} (2t - t^2) e^{-t} dt \\ &= \int_0^1 du \cdot \frac{1}{u} (t^2 e^{-t} \Big|_0^{+\infty}) = 0, \\ \text{右边} &= \int_0^{+\infty} dx \cdot \frac{1}{x} \int_0^1 (2 - t) t e^{-t} dt = \int_0^{+\infty} dx \cdot \frac{1}{x} (t^2 e^{-t} \Big|_0^1) \\ &= \int_0^{+\infty} x e^{-x} dx = - (1 + x) e^{-x} \Big|_0^{+\infty} = 1 \end{aligned}$$

原因: $\int_0^{+\infty} f(x, u) dx$ 在 $[0, 1]$ 上不一致收敛, $f(x, u) = (2 - xu)xue^{-xu}$.

$$\int_A^{+\infty} f(x, u) dx = \frac{1}{u} (xu)^2 e^{-xu} \Big|_{x=A}^{+\infty} = -A^2 u e^{-Au},$$

$$\begin{aligned} \beta(A) &= \sup_{u \in [0, 1]} \left| \int_A^{+\infty} f(x, u) dx \right| = \sup_{u \in [0, 1]} |A^2 u e^{-Au}| \\ &\geq \sup_{u \in [0, 1]} |A^2 u (1 - Au)| = \sup_{u \in [0, 1]} |-A^3 u^2 + A^2 u| = \frac{A}{4} \rightarrow +\infty, \quad (A \rightarrow +\infty), \end{aligned}$$

因此 $\int_0^{+\infty} f(x, u) dx$ 在 $[0, 1]$ 上不一致收敛. $\square$

6. 证明 $F(\alpha) = \int_0^{+\infty} \frac{\cos x}{1 + (x + \alpha)^2} dx$ 在 $0 \leq \alpha < +\infty$ 是连续且可微的函数.

证明

$$\begin{aligned} \left| \frac{\cos x}{1 + (x + \alpha)^2} \right| &\leq \frac{1}{1 + x^2}, \\ \frac{\partial f(x, \alpha)}{\partial \alpha} &= -\frac{2(x + \alpha) \cos x}{(1 + (x + \alpha)^2)^2}. \\ \left| \frac{\partial f}{\partial \alpha} \right| &\leq \begin{cases} 1, & 0 \leq x \leq 1, \\ 2x^{-3}, & x > 1, \end{cases} \quad (\alpha \geq 0). \end{aligned}$$

由优积分判别法, 原积分及其对参数的导数积分均在 $\alpha \geq 0$ 上一致收敛, 故 F 连续且可微. $\square$

7. 计算下列积分: (1) $\int_0^1 \frac{x^\beta - x^\alpha}{\ln x} dx (\alpha, \beta > -1)$ (2) $\int_0^{+\infty} \frac{1 - e^{-ax}}{xe^x} dx (a > -1)$; (3) $\int_0^{+\infty} \frac{1 - e^{-ax^2}}{x^2} dx (a > 0)$; (4) $\int_0^{+\infty} \frac{e^{-\alpha x^2} - e^{-\beta x^2}}{x} dx (\alpha, \beta > 0)$; (5) $\int_0^{+\infty} \frac{\arctan ax}{x(1+x^2)} dx$; (6) $\int_0^{+\infty} \left[e^{-\left(\frac{a}{x}\right)^2} - e^{-\left(\frac{b}{x}\right)^2} \right] dx (0 < a < b)$.

解:

(1)

$$\begin{aligned} \int_0^1 \frac{x^\beta - x^\alpha}{\ln x} dx &= \int_0^1 \int_\alpha^\beta x^t dt dx \\ &= \int_\alpha^\beta \int_0^1 x^t dx dt = \int_\alpha^\beta \frac{x^{t+1}}{t+1} \Big|_0^1 dt = \ln \frac{\beta+1}{\alpha+1} \end{aligned}$$

(2)

$$\begin{aligned} I'(a) &= \int_0^{+\infty} \frac{\partial f(x, a)}{\partial a} dx = \int_0^{+\infty} e^{-(a+1)x} dx = \frac{1}{a+1} \\ I(0) &= 0, \therefore I(a) = \ln(1+a) \end{aligned}$$

(3)

$$I'(a) = \int_0^{+\infty} \frac{\partial f(x, a) dx}{\partial a} = \int_0^{+\infty} e^{-ax^2} dx = \frac{1}{2} \sqrt{\frac{\pi}{a}}$$

$$I(0) = 0, \quad \therefore I(a) = \sqrt{\pi a}$$

补充公式

★Frullani 积分:

$$\int_0^{+\infty} \frac{f(ax) - f(bx)}{x} dx = f(0) \cdot \ln \frac{b}{a} (a > 0, b > 0),$$

(式中 $f(x)$ 为 $[0, +\infty)$ 上的连续函数, 对 $A > 0$ 存在积分 $\int_A^{+\infty} \frac{f(x)}{x} dx$.)

证明 取 $\delta > 0$, 则以下运算中的积分均存在, 于是有

$$\begin{aligned} \int_{\delta}^{+\infty} \frac{f(ax) - f(bx)}{x} dx &= \int_{\delta}^{+\infty} \frac{f(ax)}{x} dx - \int_{\delta}^{+\infty} \frac{f(bx)}{x} dx \\ &= \int_{a\delta}^{+\infty} \frac{f(t)}{t} dt - \int_{b\delta}^{+\infty} \frac{f(t)}{t} dt \\ &= \int_{a\delta}^{b\delta} \frac{f(t)}{t} dt = f(\xi) \int_{a\delta}^{b\delta} \frac{1}{t} dt = f(\xi) \ln \frac{b}{a}, \end{aligned}$$

其中 $\xi \in (a\delta, b\delta)$. 令 $\delta \rightarrow 0^+$, 由于 $f(x)$ 于点 $x = 0$ 处右连续, 因此就得到所求公式. $\square$

(4)

$$\begin{aligned} \int_0^{+\infty} \frac{e^{-\alpha x^2} - e^{-\beta x^2}}{x} dx &= \int_0^{+\infty} dx \int_{\alpha}^{\beta} x e^{-x^2 u} du = \int_{\alpha}^{\beta} du \int_0^{+\infty} x e^{-x^2 u} dx \\ &= \int_{\alpha}^{\beta} du \left(-\frac{1}{2u} e^{-x^2 u} \Big|_0^{+\infty} \right) = \int_{\alpha}^{\beta} \frac{1}{2u} du = \frac{1}{2} \ln \frac{\beta}{\alpha} \end{aligned}$$

(5)

$$\begin{aligned} \int_0^{+\infty} \frac{\arctan ax}{x(1+x^2)} dx &= \int_0^{+\infty} dx \int_0^a \frac{1}{(1+u^2 x^2)(1+x^2)} du = \int_0^a du \int_0^{+\infty} \frac{dx}{(1+u^2 x^2)(1+x^2)} \\ &= \int_0^a \frac{\pi}{2(1+u)} du = \frac{\pi}{2} \ln(a+1) \end{aligned}$$

(6)

$$\begin{aligned} \int_0^{+\infty} \left(e^{-\left(\frac{a}{x}\right)^2} - e^{-\left(\frac{b}{x}\right)^2} \right) dx &= \int_0^{+\infty} \frac{e^{-a^2 x^2} - e^{-b^2 x^2}}{x^2} dx = \int_0^{+\infty} dx \int_a^b 2ue^{-x^2 u^2} du \\ &= \int_a^b du \int_0^{+\infty} 2ue^{-x^2 u^2} dx = \int_a^b \sqrt{\pi} du = \sqrt{\pi}(b-a) \end{aligned}$$

8. 利用 $\int_0^{+\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$ 及 $\int_0^{+\infty} \frac{\sin x}{x} dx = \frac{\pi}{2}$ 计算: (1) $\int_{-\infty}^{+\infty} \frac{x}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-a}{\sigma}\right)^2} dx (\sigma > 0)$ (2) $\int_{-\infty}^{+\infty} \frac{(x-a)^2}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-a}{\sigma}\right)^2} dx (\sigma > 0)$; (3) $\int_0^{+\infty} \frac{\sin ax \cos bx}{x} dx (a > 0, b > 0)$; (4) $\int_0^{+\infty} \frac{\sin^2 x}{x^2} dx$; (5) $\int_0^{+\infty} x^{2n} e^{-x^2} dx (n \text{ 是正整数})$ (6) $\int_0^{+\infty} \frac{\sin^4 x}{x^2} dx$.

解:

(1)

$$\begin{aligned}
 \int_{-\infty}^{+\infty} \frac{x}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-a}{\sigma}\right)^2} dx &= \int_{-\infty}^{+\infty} \frac{\sigma t + a}{\sigma\sqrt{2\pi}} \cdot \sigma e^{-\frac{1}{2}t^2} dt \\
 &= \int_{-\infty}^{+\infty} \frac{\sigma t e^{-\frac{1}{2}t^2}}{\sqrt{2\pi}} dt + \int_{-\infty}^{+\infty} \frac{a}{\sqrt{2\pi}} e^{-\frac{1}{2}t^2} dt \\
 &= \frac{a}{\sqrt{2\pi}} \cdot 2\frac{\sqrt{2\pi}}{2} = a
 \end{aligned}$$

(2)

$$\begin{aligned}
 \int_{-\infty}^{+\infty} \frac{(x-a)^2}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-a}{\sigma}\right)^2} dx &= \sigma^2 \int_{-\infty}^{+\infty} t^2 \frac{1}{\sqrt{2\pi}} e^{-t^2/2} dt \\
 &= \sigma^2
 \end{aligned}$$

(3)

$$\begin{aligned}
 \int_0^{+\infty} \frac{\sin ax \cos bx}{x} dx &= \int_0^{+\infty} \frac{\sin(a-b)x + \sin(a+b)x}{2x} dx \\
 &= \int_0^{+\infty} \frac{\sin(a-b)x}{2x} dx + \frac{\pi}{4} \\
 &= \frac{\pi}{2} \mathbb{1}_{\{a>b\}} + \frac{\pi}{4} \mathbb{1}_{\{a=b\}}
 \end{aligned}$$

(4)

$$\int_0^{+\infty} \frac{\sin^2 x}{x^2} dx = \int_0^{+\infty} \frac{\sin 2x}{x} dx = \frac{\pi}{2},$$

其中第一步由分部积分得到。

(5)

$$\begin{aligned}
 \int_0^{+\infty} x^{2n} e^{-x^2} dx &= \frac{1}{2} \int_0^{+\infty} t^{n-\frac{1}{2}} e^{-t} dt \\
 &= \frac{1}{2} \Gamma\left(n + \frac{1}{2}\right) = \frac{(2n-1)!!}{2^{n+1}} \sqrt{\pi}.
 \end{aligned}$$

(6)

$$\begin{aligned}
 \int_0^{+\infty} \frac{\sin^4 x}{x^2} dx &= \int_0^{+\infty} -\sin^4 x d\left(\frac{1}{x}\right) = -\frac{\sin^4 x}{x} \Big|_0^{+\infty} + \int_0^{+\infty} \frac{4\sin^3 x \cos x}{x} dx \\
 &= \int_0^{+\infty} \frac{\sin 2x(1-\cos 2x)}{x} dx = \int_0^{+\infty} \frac{\sin 2x}{x} dx - \frac{1}{2} \int_0^{+\infty} \frac{\sin 4x}{x} dx = \frac{\pi}{4}
 \end{aligned}$$

13.5 习题 Euler 积分

1. 证明:

$$(1) \Gamma(s) = 2 \int_0^{+\infty} x^{2s-1} e^{-x^2} dx (s > 0) \quad (2) \Gamma(s) = a^s \int_0^{+\infty} x^{s-1} e^{-ax} dx (s > 0, a > 0).$$

证明:

$$(1) \text{ 令 } t = x^2, dx = \frac{dt}{2\sqrt{t}}$$

$$\text{右边} = 2 \int_0^{+\infty} e^{-t} t^{s-\frac{1}{2}} \frac{dt}{2\sqrt{t}} = \int_0^{+\infty} t^{s-1} e^{-t} dt = \Gamma(s)$$

$$(2) \text{ 令 } t = ax, dx = \frac{dt}{a}$$

$$\text{右边} = a^s \int_0^{+\infty} \left(\frac{t}{a}\right)^{s-1} e^{-t} \frac{dt}{a} = \int_0^{+\infty} t^{s-1} e^{-t} dt = \Gamma(s)$$

□

2. 证明:

$$B(p, q) = 2 \int_0^{\frac{\pi}{2}} \sin^{2p-1} t \cos^{2q-1} t dt (p > 0, q > 0)$$

$$\text{证明: 令 } t = \sin^2 x, \quad dt = 2 \sin x \cos x dx.$$

$$B(p, q) = \int_0^1 t^{p-1} (1-t)^{q-1} dt = 2 \int_0^{\frac{\pi}{2}} \sin^{2p-1} x \cos^{2q-1} x dx$$

□

3. 利用 Euler 积分计算:

$$\begin{aligned} (1) \int_0^1 \sqrt{x-x^2} dx \quad (2) \int_0^a x^2 \sqrt{a^2-x^2} dx; \quad (3) \int_0^{\frac{\pi}{2}} \sin^6 x \cos^4 x dx; \quad (4) \\ \int_0^1 x^{n-1} (1-x^m)^{q-1} dx (n, m, q > 0); \quad (5) \int_0^{+\infty} e^{-at} \frac{1}{\sqrt{\pi t}} dt (a > 0); \quad (6) \\ \int_0^{\frac{\pi}{2}} \tan^\alpha x dx \quad (|\alpha| < 1); \quad (7) \int_0^1 \sqrt{\frac{1}{x} \ln \frac{1}{x}} dx \quad (8) \int_a^b \left(\frac{b-x}{x-a}\right)^p dx (0 < p < 1); \quad (9) \\ \lim_{n \rightarrow \infty} \int_1^2 (x-1)^2 \cdot \sqrt[n]{\frac{2-x}{x-1}} dx; \quad (10) \lim_{n \rightarrow \infty} \int_0^{+\infty} \frac{1}{1+x^n} dx. \end{aligned}$$

解:

(1)

$$\begin{aligned} \int_0^1 \sqrt{x-x^2} dx &= \int_0^1 \sqrt{x} \sqrt{1-x} dx = B\left(\frac{3}{2}, \frac{3}{2}\right) \\ &= \frac{[\Gamma(\frac{3}{2})]^2}{\Gamma(3)} = \frac{[\frac{1}{2}\Gamma(\frac{1}{2})]^2}{2!} = \frac{\pi}{8} \end{aligned}$$

(2)

$$\begin{aligned}\int_0^a x^2 \sqrt{a^2 - x^2} dx &= \int_0^1 a^2 t \cdot a(1-t)^{\frac{1}{2}} a \frac{dt}{2\sqrt{t}} \\ &= \frac{a^4}{2} \int_0^1 t^{\frac{1}{2}} (1-t)^{\frac{1}{2}} dt = \frac{a^4}{2} B\left(\frac{3}{2}, \frac{3}{2}\right) = \frac{a^4 \pi}{16}\end{aligned}$$

(3)

$$\begin{aligned}I &= \frac{1}{2} B\left(\frac{7}{2}, \frac{5}{2}\right) = \frac{1}{2} \cdot \frac{\Gamma\left(\frac{7}{2}\right) \Gamma\left(\frac{5}{2}\right)}{\Gamma(6)} = \frac{1}{2} \cdot \frac{5}{2} \frac{[\Gamma\left(\frac{5}{2}\right)]^2}{5!} \\ &= \frac{1}{96} \left[\frac{3}{2} \cdot \frac{1}{2} \cdot \Gamma\left(\frac{1}{2}\right) \right]^2 = \frac{3\pi}{512}.\end{aligned}$$

(4)

$$\begin{aligned}x^m &= t, \quad t^{\frac{1}{m}} = x, \quad dx = \left(\frac{1}{m}\right) t^{\left(\frac{1}{m}-1\right)} dt \\ I &= \int_0^1 t^{\frac{n-1}{m}} (1-t)^{q-1} \cdot \left(\frac{1}{m}\right) t^{\left(\frac{1}{m}-1\right)} dt \\ &= \frac{1}{m} \int_0^1 t^{\frac{n}{m}-1} (1-t)^{q-1} dt = \frac{1}{m} B\left(\frac{n}{m}, q\right)\end{aligned}$$

(5)

$$\begin{aligned}\int_0^{+\infty} e^{-at} \frac{1}{\sqrt{\pi t}} dt &= \frac{1}{\sqrt{\pi}} \int_0^{+\infty} e^{-x} \sqrt{\frac{a}{x}} \frac{dx}{a} \\ &= \frac{1}{\sqrt{a\pi}} \int_0^{+\infty} e^{-x} x^{-\frac{1}{2}} dx = \frac{\Gamma\left(\frac{1}{2}\right)}{\sqrt{a\pi}} = \frac{1}{\sqrt{a}}\end{aligned}$$

(6)

$$\begin{aligned}\int_0^{\frac{\pi}{2}} \tan^\alpha x dx \quad \tan^\alpha x &= \left(\frac{\sin x}{\cos x}\right)^\alpha = \sin^\alpha x \cos^{-\alpha} x \\ 2p-1 &= \alpha, p = \frac{\alpha+1}{2} \quad 2q-1 = -\alpha, q = \frac{1-\alpha}{2} \\ \therefore I &= \frac{1}{2} B\left(\frac{\alpha+1}{2}, \frac{1-\alpha}{2}\right) = \frac{1}{2} \frac{\Gamma\left(\frac{\alpha+1}{2}\right) \Gamma\left(\frac{1-\alpha}{2}\right)}{\Gamma(1)} \\ &= \frac{1}{2} \Gamma\left(\frac{\alpha+1}{2}\right) \Gamma\left(\frac{1-\alpha}{2}\right) = \frac{\pi}{2 \sin \frac{\alpha+1}{2} \pi} = \frac{\pi}{2 \cos \frac{\alpha\pi}{2}}.\end{aligned}$$

(7)

$$\begin{aligned}\text{令 } t &= \ln \frac{1}{x}, \quad x = e^{-t}, \quad dx = -e^{-t} dt, \\ \int_0^1 \sqrt{\frac{1}{x} \ln \frac{1}{x}} dx &= \int_0^{+\infty} e^{-\frac{t}{2}} t^{\frac{1}{2}} dt = 2\sqrt{2} \Gamma\left(\frac{3}{2}\right) = \sqrt{2\pi}.\end{aligned}$$

(8)

$$\begin{aligned}
 x &= a + (b-a)t, \quad x-a = (b-a)t, \quad b-x = (b-a)(1-t) \\
 \int_a^b \left(\frac{b-x}{x-a} \right)^p dx &= \int_0^1 \frac{(b-a)^p (1-t)^p}{(b-a)^p t^p} (b-a) dt \\
 &= (b-a) \int_0^1 t^{-p} (1-t)^p dt = (b-a) B(p+1, 1-p)
 \end{aligned}$$

(9)

$$\begin{aligned}
 x &= 1+t, \quad dx = dt \\
 I &= \int_1^2 (x-1)^{2-\frac{1}{n}} (2-x)^{\frac{1}{n}} dx = \int_0^1 t^{2-\frac{1}{n}} (1-t)^{\frac{1}{n}} \\
 &= B\left(3-\frac{1}{n}, \frac{1}{n}+1\right), \quad \lim_{n \rightarrow +\infty} I = B(3, 1) = \frac{1}{3}
 \end{aligned}$$

(10)

$$\begin{aligned}
 \text{运用到 } B(x, y) &= \int_0^{+\infty} \frac{u^{y-1}}{(1+u)^{x+y}} du \\
 \int_0^{+\infty} \frac{x^{m-1}}{1+x^n} dx &= \frac{1}{n} \int_0^{+\infty} \frac{t^{\frac{m}{n}-1}}{1+t} dt \\
 &= \frac{1}{n} B\left(1-\frac{m}{n}, \frac{m}{n}\right) = \frac{1}{n} \Gamma\left(\frac{m}{n}\right) \Gamma\left(1-\frac{m}{n}\right) = \frac{\pi}{n \sin \frac{m\pi}{n}} \\
 \lim_{n \rightarrow \infty} \int_0^{+\infty} \frac{1}{1+x^n} dx &= \lim_{n \rightarrow +\infty} \frac{\pi}{n \sin \frac{\pi}{n}} = \lim_{n \rightarrow +\infty} \frac{\frac{\pi}{n}}{\sin \frac{\pi}{n}} = 1
 \end{aligned}$$

4. 计算极限

$$\lim_{\alpha \rightarrow +\infty} \sqrt{\alpha} \int_0^1 x^{\frac{3}{2}} (1-x^5)^\alpha dx.$$

解:

$$\begin{aligned}
 \text{原式} &= \sqrt{\alpha} \int_0^1 x^{\frac{3}{2}} (1-x^5)^\alpha dx = \sqrt{\alpha} \int_0^1 t^{\frac{3}{10}} (1-t)^\alpha \cdot \frac{1}{5} t^{-\frac{4}{5}} dt \\
 &= \frac{\sqrt{\alpha}}{5} \int_0^1 t^{-\frac{1}{2}} (1-t)^\alpha dt = \frac{\sqrt{\alpha}}{5} B\left(\frac{1}{2}, 1+\alpha\right)
 \end{aligned}$$

$$\lim_{\alpha \rightarrow +\infty} \frac{\sqrt{\alpha}}{5} B\left(\frac{1}{2}, 1+\alpha\right) = \lim_{n \rightarrow +\infty} \frac{\sqrt{n}}{5} B\left(\frac{1}{2}, 1+n\right)$$

$$(\text{课本 336 页 } B \text{ 函数的递推公式与课本 337 页 } B(p, p) = \frac{1}{2^{2p-1}} B\left(\frac{1}{2}, p\right))$$

$$= \lim_{n \rightarrow +\infty} \frac{\sqrt{n}}{5} \frac{n! n! 2^{2n+1}}{(2n+1)!}$$

$$= \frac{\sqrt{\pi}}{5}. (\text{斯特林公式或 Wallis 公式})$$

5. 设 $a > 0$, 试求由曲线 $x^n + y^n = a^n$ 和两坐标轴所围成平面图形在第一象限的面积.

解:

$$\begin{aligned} S &= \int_0^a y dx = \int_0^a (a^n - x^n)^{\frac{1}{n}} dx \\ &= a^2 \int_0^1 (1 - u^n)^{\frac{1}{n}} du \\ &= \frac{a^2}{n} \int_0^1 t^{\frac{1}{n}-1} (1-t)^{\frac{1}{n}} dt = \frac{a^2}{n} B\left(\frac{1}{n}, \frac{1}{n} + 1\right) \end{aligned}$$

6. 设 $0 < \alpha < 1$, 证明 (1) 对于 $x > 0$ 有 $x^\alpha - \alpha x + \alpha - 1 \leq 0$. 并由此推出下列不等式

$$a^\alpha b^{1-\alpha} \leq \alpha a + (1-\alpha)b, \text{ 这里 } a > 0, b > 0$$

(2) 设 $x_i \geq 0, y_i \geq 0, (i = 1, \dots, n)$, 则有 Hölder 不等式

$$\sum_{i=1}^n x_i y_i \leq \left(\sum_{i=1}^n x_i^{\frac{1}{\alpha}} \right)^\alpha \left(\sum_{i=1}^n y_i^{\frac{1}{1-\alpha}} \right)^{1-\alpha}$$

(3) 设 $f \geq 0, g \geq 0$, 并且连续, 利用 Hölder 不等式, 通过 Riemann 和取极限的方法, 证明积分形式的 Hölder 不等式

$$\int_a^b f(x)g(x)dx \leq \left(\int_a^b f^{\frac{1}{\alpha}}(x)dx \right)^\alpha \left(\int_a^b g^{\frac{1}{1-\alpha}}(x)dx \right)^{1-\alpha}$$

以及

$$\int_a^\infty f(x)g(x)dx \leq \left(\int_a^\infty f^{\frac{1}{\alpha}}(x)dx \right)^\alpha \left(\int_a^\infty g^{\frac{1}{1-\alpha}}(x)dx \right)^{1-\alpha}$$

这里均假设所涉及的反常积分是收敛的.

(4) 证明 $\ln \Gamma(x)$ 是凸函数.

证明: (1)

$$\begin{aligned} f(x) &= x^\alpha - \alpha x + \alpha - 1, \\ f'(x) &= \alpha x^{\alpha-1} - \alpha, \quad f''(x) = \alpha(\alpha-1)x^{\alpha-2} < 0. \end{aligned}$$

故 f 为凹函数, 且在 $x = 1$ 处取得最大值 $f(1) = 0$, 于是 $x^\alpha \leq \alpha x + 1 - \alpha$. 令 $x = a/b$ 并乘以 b , 即得 $a^\alpha b^{1-\alpha} \leq \alpha a + (1-\alpha)b$.

(2) 记

$$X = \left(\sum_i x_i^{1/\alpha} \right)^\alpha, \quad Y = \left(\sum_i y_i^{1/(1-\alpha)} \right)^{1-\alpha}.$$

当 $XY > 0$ 时, 对每个 i 应用 (1) 的 Young 不等式, 得到

$$\frac{x_i}{X} \frac{y_i}{Y} \leq \alpha \left(\frac{x_i}{X} \right)^{1/\alpha} + (1-\alpha) \left(\frac{y_i}{Y} \right)^{1/(1-\alpha)}.$$

求和后右端为 1, 故 $\sum_i x_i y_i \leq XY$; $XY = 0$ 时结论显然成立。

(3) 对 $[a, b]$ 的任一分割及相应取样点 ξ_i , 在离散 Hölder 不等式中取 $x_i = f(\xi_i)(\Delta x_i)^\alpha$, $y_i = g(\xi_i)(\Delta x_i)^{1-\alpha}$, 得到

$$\sum_i f(\xi_i)g(\xi_i)\Delta x_i \leq \left(\sum_i f(\xi_i)^{1/\alpha}\Delta x_i\right)^\alpha \left(\sum_i g(\xi_i)^{1/(1-\alpha)}\Delta x_i\right)^{1-\alpha}.$$

令分割直径趋于零即得有限区间上的积分型 Hölder 不等式; 再令上端点趋于 $+\infty$, 得到反常积分形式。

(4) 解答: 只需证明 $(\ln \Gamma(x))'' \geq 0$. 事实上, 由

$$(\ln \Gamma(x))'' = \frac{d}{dx} \left(\frac{\Gamma'(x)}{\Gamma(x)} \right) = \frac{\Gamma''(x)\Gamma(x) - [\Gamma'(x)]^2}{\Gamma^2(x)}$$

而由 Cauchy-Schwarz 不等式可知

$$\begin{aligned} \Gamma''(x)\Gamma(x) &= \left(\int_0^{+\infty} t^{x-1} \ln^2 t e^{-t} dt \right) \left(\int_0^{+\infty} t^{x-1} e^{-t} dt \right) \\ &\geq \left(\int_0^{+\infty} \sqrt{t^{x-1} e^{-t}} \cdot \sqrt{t^{x-1} e^{-t}} \ln t dt \right)^2 \\ &= \left(\int_0^{+\infty} t^{x-1} \ln t e^{-t} dt \right)^2 = [\Gamma'(x)]^2 \end{aligned}$$

故 $(\ln \Gamma(x))'' \geq 0$, 即 $\ln \Gamma(x)$ 是下凸函数. □

13.6 第 13 章综合习题

1. 设函数 $f(x) \geq 0$ 并在 $[a, +\infty)$ 的任何有限区间上可积, 数列 $\{a_n\}$ 单调增并 $a_0 = 0, a_n \rightarrow +\infty (n \rightarrow +\infty)$. 证明: 积分 $\int_0^{+\infty} f(x)dx$ 收敛于 l 当且仅当级数 $\sum_{n=1}^{+\infty} \int_{a_{n-1}}^{a_n} f(x)dx$ 收敛于 l .

证明 因为 $f(x) \geq 0$, 所以利用非负函数积分和正项级数有界性, 或利用收敛性的 Cauchy 收敛准则对任意的 $A > 0$, 因 $a_n \rightarrow \infty$, 所以存在 a_n 使得 $a_{n-1} \leq A \leq a_n$.

$$\therefore \sum_{k=1}^{n-1} \int_{a_{k-1}}^{a_k} f(x)dx \leq \int_0^A f(x)dx \leq \sum_{k=1}^n \int_{a_{k-1}}^{a_k} f(x)dx$$

所以任何有限区间上积分有界当且仅当级数部分和有界. 即得结果. $\square$

2. 证明: 下列积分

$$\int_0^{+\infty} \frac{x dx}{1+x^6 \sin^2 x}$$

收敛. 但被积函数 $f(x) = \frac{x}{1+x^6 \sin^2 x}$ 在 $[0, +\infty)$ 上非负、连续、无界 (因此当 $x \rightarrow +\infty$ 时, $f(x)$ 的极限不为零). 提示: 利用上题结果.

证明 取 $a_n = n\pi$. 对 $n \geq 1$, 令 $x = n\pi + u$, 利用 $\sin^2 x = \sin^2 u$, 有

$$\begin{aligned} 0 &\leq \int_{n\pi}^{(n+1)\pi} \frac{x dx}{1+x^6 \sin^2 x} \\ &\leq (n+1)\pi \int_0^\pi \frac{du}{1+n^6 \pi^6 \sin^2 u} \\ &= (n+1)\pi \cdot \frac{\pi}{\sqrt{1+n^6 \pi^6}} \leq \frac{n+1}{n^3 \pi}. \end{aligned}$$

右端构成收敛级数, 故由第 1 题原积分收敛; 同时 $f(n\pi) = n\pi \rightarrow +\infty$, 所以被积函数确实无界. $\square$

3. 设 φ 有二阶导数, ψ 有一阶导数. 证明:

$$u(x, t) = \frac{1}{2}(\varphi(x-at) + \varphi(x+at)) + \frac{1}{2a} \int_{x-at}^{x+at} \psi(s)ds$$

$$\text{满足弦振动方程 } \frac{\partial^2 u}{\partial t^2} = a^2 \frac{\partial^2 u}{\partial x^2}$$

证明

$$\begin{aligned}\frac{\partial u}{\partial t} &= \frac{1}{2} [-a\varphi'(x-at) + a\varphi'(x+at)] + \frac{1}{2a} [a\psi(x+at) + a\psi(x-at)] \\ \frac{\partial^2 u}{\partial t^2} &= \frac{a^2}{2} [\varphi''(x-at) + \varphi''(x+at)] + \frac{a}{2} [\psi'(x+at) - \psi'(x-at)] \\ \frac{\partial u}{\partial x} &= \frac{1}{2} [\varphi'(x-at) + \varphi'(x+at)] + \frac{1}{2a} [\psi(x+at) - \psi(x-at)] \\ \frac{\partial^2 u}{\partial x^2} &= \frac{1}{2} [\varphi''(x-at) + \varphi''(x+at)] + \frac{1}{2a} [\psi'(x+at) - \psi'(x-at)] \\ \therefore \frac{\partial^2 u}{\partial t^2} &= a^2 \frac{\partial^2 u}{\partial x^2}, \quad u(x, 0) = \varphi(x), \quad \frac{\partial u}{\partial t}(x, 0) = \psi(x).\end{aligned}$$

□

重要结论

★ 含参变量积分的可微:

(1) $\varphi(u)$ 在区域 $D(x \in [a, b], x \in [\alpha, \beta])$ 上连续, 且 D 中对 u 偏导数连续

$$\varphi'(u) = \int_a^b \frac{\partial f(x, u)}{\partial u} dx$$

(2) 在 (1) 条件中, 加入 $a(u), b(u)$ 对 u 可导, 则有

$$\varphi'(u) = \int_{a(u)}^{b(u)} \frac{\partial f(x, u)}{\partial u} dx + f(b(u), u)b'(u) - f(a(u), u)a'(u)$$

4. 证明: n 阶 Bessel 函数

$$J_n(x) = \frac{1}{\pi} \int_0^\pi \cos(n\varphi - x \sin \varphi) d\varphi$$

满足 Bessel 方程

$$x^2 J_n''(x) + x J_n'(x) + (x^2 - n^2) J_n(x) = 0.$$

证明: 记 $\theta = n\varphi - x \sin \varphi$. 在积分号下求导得

$$\begin{aligned}J_n'(x) &= \frac{1}{\pi} \int_0^\pi \sin \varphi \sin \theta d\varphi, \\ J_n''(x) &= -\frac{1}{\pi} \int_0^\pi \sin^2 \varphi \cos \theta d\varphi.\end{aligned}$$

因此

$$\begin{aligned}& x^2 J_n''(x) + x J_n'(x) + (x^2 - n^2) J_n(x) \\ &= -\frac{1}{\pi} \int_0^\pi [(n^2 - x^2 \cos^2 \varphi) \cos \theta - x \sin \varphi \sin \theta] d\varphi \\ &= -\frac{1}{\pi} [(n + x \cos \varphi) \sin(n\varphi - x \sin \varphi)]_0^\pi = 0.\end{aligned}$$

□

5. 证明: 对任意实数 u , 有

$$\frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} \cos(u \sin x) dx = 1$$

证明 令 $\psi(u) = \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} \cos(u \sin x) dx$, 则

$$\begin{aligned} \psi'(u) &= \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} (\cos x \cos(u \sin x) - \sin x \sin(u \sin x)) dx \\ &= \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} \cos(u \sin x + x) dx \\ \psi''(u) &= \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} \cos(u \sin x + 2x) dx \\ \psi^{(n)}(u) &= \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} \cos(u \sin x + nx) dx \end{aligned}$$

显然每一步求导都是合理的, 同时对于任意给定的 u , 存在 M , 使得 $|u| \leq M$, $|\psi^{(n)}(u)| \leq e^M$, 所以 $\psi(u)$ 在 $[-M, M]$ 中可以展开成 Taylor 级数. 注意到 $\psi(0) = 1, \psi^{(n)}(0) = 0, n = 1, 2, \dots$, 所以对任意的 u , 有 $\psi(u) = \psi(0) = 1$.

★ 一种更巧妙的证明, 将积分化为曲线积分并利用 Green 公式:

视 x 为角度, 令 $\xi = \cos x, \eta = \sin x, \therefore d\xi = -\sin x dx, d\eta = \cos x dx$, 则

$$\begin{aligned} \psi'(u) &= \frac{1}{2\pi} \int_0^{2\pi} e^{u \cos x} (\cos x \cos(u \sin x) - \sin x \sin(u \sin x)) dx \\ &= \frac{1}{2\pi} \oint_{\xi^2 + \eta^2 = 1} e^{u\xi} (\cos(u\eta) d\eta + \sin(u\eta) d\xi) \\ &= \frac{1}{2\pi} \iint_{\xi^2 + \eta^2 \leq 1} \left(\frac{\partial (e^{u\xi} \cos(u\eta))}{\partial \xi} - \frac{\partial (e^{u\xi} \sin(u\eta))}{\partial \eta} \right) d\xi d\eta = 0 \end{aligned}$$

所以 $\psi(u) = \psi(0) = 1$. □

6. 证明: 积分 $\int_0^{+\infty} \frac{\sin 3x}{x+u} e^{-ux} dx$ 关于 u 在 $[0, +\infty)$ 上一致收敛.

证明 利用 Dirichlet 判别法, 不难验证在任何有限区间上

$$\left| \int_a^b \sin 3x dx \right| \leq \frac{2}{3}$$

对 u 一致有界. 关键是要验证 $f(x, u) = \frac{e^{-ux}}{x+u}$ 对任何 $u \geq 0$ 是 x 的单调函数且当 $x \rightarrow +\infty$ 时, 关于 $u \geq 0$ 一致趋于零.

$$\therefore \frac{\partial f}{\partial x} = -e^{-ux} \left(\frac{u(x+u)+1}{(x+u)^2} \right) \leq 0 (x \geq 0, u \geq 0)$$

因此 $f(x, u)$ 是 x 的单调函数. 对任何 $u \geq 0$,

$$|f(x, u)| = \left| \frac{e^{-ux}}{x+u} \right| \leq \frac{1}{x} \rightarrow 0 (x \rightarrow +\infty)$$

$\therefore f(x, u) = \frac{e^{-ux}}{x+u}$ 对任何 $u \geq 0$ 是 x 的单调函数, 且当 $x \rightarrow +\infty$, 关于 $u \geq 0$ 一致趋于零. $\square$

7. 证明: 积分

$$\int_0^{+\infty} \frac{x \cos ux}{x^2 + a^2} dx (a > 0)$$

关于 u 在 $[\delta, +\infty)$ ($\delta > 0$) 上一致收敛, 但在 $(0, +\infty)$ 上不一致收敛.

证明 假如积分在 $u \geq 0$ 一致收敛, 那么根据一致收敛的 Cauchy 收敛准则, 对任意 $\forall \varepsilon > 0$, 一定存在 $\exists M > 0$, 使得对 $\forall A > M, \forall A' > M$, 有

$$\left| \int_A^{A'} \frac{x \cos ux}{x^2 + a^2} dx \right| < \varepsilon$$

对任何 $u \geq 0$ 成立, 因此

$$\sup_{u \geq 0} \left| \int_A^{A'} \frac{x \cos ux}{x^2 + a^2} dx \right| \leq \varepsilon$$

对任意的 $A > M$, 取 $A' = \alpha A, u = \frac{1}{A}$, 其中 $1 < \alpha < \frac{\pi}{2}$, 那么

$$\begin{aligned} \varepsilon &\geq \sup_{u \geq 0} \left| \int_A^{A'} \frac{x \cos ux}{x^2 + a^2} dx \right| \\ &\geq \left| \int_A^{A'} \frac{x \cos ux}{x^2 + a^2} dx \right|_{u=\frac{1}{A}} = \left| \int_A^{\alpha A} \frac{x \cos \frac{x}{A}}{x^2 + a^2} dx \right| \\ &= \int_1^\alpha \frac{A^2 t \cos t}{A^2 t^2 + a^2} dt \geq \cos \alpha \int_1^\alpha \frac{A^2 t}{A^2 t^2 + a^2} dt \\ &= \frac{1}{2} \cos \alpha \ln \frac{A^2 \alpha^2 + a^2}{A^2 + a^2} \end{aligned}$$

令 $A \rightarrow +\infty$, 就有

$$\varepsilon \geq \cos \alpha \ln \alpha > 0$$

这里用到了 $\cos t$ 在 $[1, \alpha] \subset [0, \frac{\pi}{2}]$ 上单调减. 上述结论与 $\varepsilon > 0$ 的任意性矛盾, 因此积分在 $u > 0$ 上不一致收敛. 若 $u \geq \delta > 0$, 则 $\left| \int_A^B \cos(ux) dx \right| \leq 2/\delta$, 而 $x/(x^2 + a^2)$ 最终单调递减趋零, 故由一致 Dirichlet 判别法知积分一致收敛. $\square$

8. 证明: 积分

$$\int_0^{+\infty} \frac{x \sin ux}{x^2 + a^2} dx (a > 0)$$

关于 u 在 $(0, +\infty)$ 上不一致收敛.

证明方法同上题, 只是注意到 $\sin x$ 在 $[1, \alpha] \subset [0, \frac{\pi}{2}]$ 上单调增即可. $\square$

9. 设 $\int_{-\infty}^{+\infty} |f(x)| dx$ 收敛. 证明: 函数

$$\varphi(u) = \int_{-\infty}^{+\infty} f(x) \cos ux \, dx$$

在 $(-\infty, +\infty)$ 上一致连续.

本题要证明函数 $\varphi(u)$ 在 $|u| < \infty$ 上一致连续, 即对任意的 $\varepsilon > 0$, 要找到这样的 $\delta > 0$, 使得对任何 u, u' , 只要 $|u - u'| < \delta$, 就有 $|\varphi(u) - \varphi(u')| < \varepsilon$.

证明 因 $|f(x) \cos ux| \leq |f(x)|$, 所以积分 $\int_{-\infty}^{+\infty} f(x) \cos ux \, dx$ 关于 $|u| < \infty$ 一致收敛. 所以函数 $\varphi(u)$ 在 $|u| < \infty$ 有定义且连续. 下面要证 $\varphi(u)$ 是 $|u| < \infty$ 上一致连续函数. $\forall \varepsilon > 0$, 存在 $M > 0$, 使得

$$\begin{aligned} \int_M^{+\infty} |f(x)| dx &< \frac{\varepsilon}{5}, \quad \int_{-\infty}^{-M} |f(x)| dx < \frac{\varepsilon}{5}, \\ \text{记 } A &= \int_{-\infty}^{+\infty} |f(x)| dx, \text{ 取} \\ 0 < \delta &< \frac{\varepsilon}{5M(A+1)}, \end{aligned}$$

则对于任意的 u, u' , 当 $|u - u'| < \delta$ 时, 就有

$$\begin{aligned} |\varphi(u) - \varphi(u')| &= \left| \int_{-\infty}^{+\infty} f(x) \cos ux \, dx - \int_{-\infty}^{+\infty} f(x) \cos u'x \, dx \right| \\ &\leq \int_{-M}^M |f(x)| |\cos ux - \cos u'x| \, dx \\ &\quad + \int_{-\infty}^{-M} |f(x)| |\cos ux - \cos u'x| \, dx + \int_M^{+\infty} |f(x)| |\cos ux - \cos u'x| \, dx \\ &\leq \int_{-M}^M |f(x)| |x| |u - u'| \, dx + 2 \int_{-\infty}^{-M} |f(x)| \, dx + 2 \int_M^{+\infty} |f(x)| \, dx \\ &\leq MA |u - u'| + \frac{4}{5} \varepsilon < \varepsilon \end{aligned}$$

这样就证明了 $\varphi(u)$ 的一致连续性. $\square$

10. 证明: 函数

$$f(x) = \int_0^{+\infty} \frac{e^{-t}}{|\sin t|^x} \, dt$$

在 $[0, 1)$ 上连续.

证明 注意该题积分在 $t = n\pi$ 都是瑕点, 因此需要分段考虑. 利用第 1 题结果, 取 $a_n = n\pi$, 因

此

$$\begin{aligned}
 f(x) &= \int_0^{+\infty} \frac{e^{-t}}{|\sin t|^x} dt \\
 &= \sum_{n=0}^{+\infty} \int_{n\pi}^{(n+1)\pi} \frac{e^{-t}}{|\sin t|^x} dt = \sum_{n=0}^{+\infty} \int_0^{\pi} \frac{e^{-u-n\pi}}{|\sin u|^x} du \\
 &= \left(\sum_{n=0}^{+\infty} e^{-n\pi} \right) \int_0^{\pi} \frac{e^{-u}}{|\sin u|^x} du \\
 &= \frac{1}{1-e^{-\pi}} \int_0^{\pi} \frac{e^{-u}}{\sin^x u} du
 \end{aligned}$$

因此, 只要证明瑕积分 $\int_0^{\pi} \frac{e^{-u}}{\sin^x u} du$ 在 $0 \leq x < 1$ 收敛且连续即可. 因为

$$\begin{aligned}
 \frac{e^{-u}}{\sin^x u} &\sim \frac{1}{u^x} \quad u \rightarrow 0^+ \\
 \frac{e^{-u}}{\sin^x u} &\sim \frac{1}{(\pi-u)^x} \quad u \rightarrow \pi^-
 \end{aligned}$$

所以瑕积分

$$\int_0^{\pi} \frac{e^{-u}}{\sin^x u} du = \int_0^{\frac{\pi}{2}} \frac{e^{-u}}{\sin^x u} du + \int_{\frac{\pi}{2}}^{\pi} \frac{e^{-u}}{\sin^x u} du$$

在 $0 \leq x < 1$ 收敛. $\forall x_0 \in [0, 1), \exists \delta > 0$, 使得 $0 \leq x_0 < 1 - \delta$, 且

$$\frac{e^{-t}}{|\sin t|^{1-\delta}} \sim \frac{1}{t^{1-\delta}} \quad (t \rightarrow 0^+)$$

$x \in [0, 1 - \delta]$, 有

$$\frac{e^{-t}}{|\sin t|^x} \leq \frac{e^{-t}}{|\sin t|^{1-\delta}},$$

所以由 Weierstrass 定理, $\int_0^{\frac{\pi}{2}} \frac{e^{-t}}{|\sin t|^x} dt$ 在 $[0, 1 - \delta]$ 上一致收敛, 被积函数显然是 x 的连续函数,

这样就得到 $\int_0^{\frac{\pi}{2}} \frac{e^{-t}}{|\sin t|^x} dt$ 在 $[0, 1 - \delta]$ 上连续, 同理可证 $\int_{\frac{\pi}{2}}^{\pi} \frac{e^{-t}}{|\sin t|^x} dt$ 在 $[0, 1 - \delta]$ 上也连续, 因此函数 $f(x)$ 在 $[0, 1 - \delta]$ 上连续, 推出在 x_0 连续, 由于 $0 \leq x_0 < 1$ 的任意性, 得 $f(x)$ 在 $[0, 1)$ 上连续. $\square$

$$11. \text{ 证明: } \int_0^1 \ln \Gamma(x) dx = \ln \sqrt{2\pi}.$$

证明 对 $0 < x < 1$, 在余元公式两边取对数并积分

$$\int_0^1 \ln \Gamma(x) dx + \int_0^1 \ln \Gamma(1-x) dx = \int_0^1 \ln \pi dx - \int_0^1 \ln \sin \pi x dx$$

对左边第二个积分换元:

$$2 \int_0^1 \ln \Gamma(x) dx = \ln \pi - \int_0^1 \ln \sin \pi x dx = \ln \pi - \frac{1}{\pi} \int_0^{\pi} \ln \sin x dx$$

下面计算右边的积分。令 $I = \int_0^{\pi/2} \ln(\sin x) dx$, 由代换 $x \mapsto \pi/2 - x$, 亦有 $I = \int_0^{\pi/2} \ln(\cos x) dx$ 。于是

$$2I = \int_0^{\pi/2} \ln\left(\frac{1}{2} \sin 2x\right) dx = -\frac{\pi}{2} \ln 2 + \frac{1}{2} \int_0^{\pi} \ln(\sin u) du = -\frac{\pi}{2} \ln 2 + I.$$

故 $I = -\frac{\pi}{2} \ln 2$, 从而

$$\begin{aligned} \int_0^{\pi} \ln \sin x \, dx &= -\pi \ln 2 \\ \int_0^1 \ln \Gamma(x) dx &= \frac{1}{2}(\ln \pi + \ln 2) = \ln \sqrt{2\pi}. \end{aligned}$$

□

12. 证明:

$$\int_0^1 \sin(\pi x) \ln \Gamma(x) dx = \frac{1}{\pi} \left(\ln \frac{\pi}{2} + 1 \right)$$

证明 类似第 11 题, 有

$$\begin{aligned} \int_0^1 \sin \pi x \ln \Gamma(x) dx + \int_0^1 \sin \pi x \ln \Gamma(1-x) dx &= \int_0^1 \sin \pi x \ln \pi dx - \int_0^1 \sin \pi x \ln \sin \pi x \, dx. \\ \implies 2 \int_0^1 \sin \pi x \ln \Gamma(x) dx &= \frac{2}{\pi} \ln \pi - \frac{1}{\pi} \int_0^{\pi} \sin x \ln \sin x \, dx \end{aligned}$$

下面计算右边的积分.

$$\int_0^{\pi} \sin x \ln \sin x \, dx = 2 \int_0^{\pi} \sin \frac{x}{2} \cos \frac{x}{2} \ln \left(2 \sin \frac{x}{2} \cos \frac{x}{2} \right) dx$$

令 $\sin \frac{x}{2} = u$, 则

$$\begin{aligned} \int_0^{\pi} \sin x \ln \sin x \, dx &= 4 \int_0^1 u \ln \left(2u\sqrt{1-u^2} \right) du \\ &= 4 \int_0^1 u \left(\ln 2 + \ln u + \frac{1}{2} \ln (1-u^2) \right) du \\ &= 4 \left(\frac{1}{2} \ln 2 - \frac{1}{4} - \frac{1}{4} \right) \end{aligned}$$

这里要注意积分

$$\begin{aligned} \int_0^1 u \ln (1-u^2) \, du &= -\frac{1}{2} \int_0^1 \ln (1-u^2) \, d(1-u^2) = -\int_0^1 u \, du = -\frac{1}{2}. \\ \therefore \int_0^1 \sin(\pi x) \ln \Gamma(x) dx &= \frac{1}{\pi} \left(\ln \frac{\pi}{2} + 1 \right) \end{aligned}$$

□

13. 证明:

$$\int_0^{\pi} \frac{dx}{\sqrt{3-\cos x}} = \frac{1}{4\sqrt{\pi}} \Gamma^2\left(\frac{1}{4}\right)$$

证明 利用三角函数半角公式 $\cos x = 1 - 2\sin^2 \frac{x}{2}$, 得 $3 - \cos x = 2(1 + \sin^2 \frac{x}{2})$. 令

$$\begin{aligned} u = \sin^2 \frac{x}{2}, & \Rightarrow du = \sin \frac{x}{2} \cos \frac{x}{2} dx = \sqrt{u(1-u)} dx, \\ \int_0^\pi \frac{dx}{\sqrt{3-\cos x}} &= \int_0^1 \frac{du}{\sqrt{2(1+u)u(1-u)}} = \int_0^1 \frac{du}{\sqrt{2u(1-u^2)}} \\ &= \frac{1}{2\sqrt{2}} \int_0^1 \frac{dt}{t^{3/4}(1-t)^{1/2}} = \frac{1}{2\sqrt{2}} \int_0^1 t^{1/4-1}(1-t)^{\frac{1}{2}-1} \\ &= \frac{1}{2\sqrt{2}} B\left(\frac{1}{4}, \frac{1}{2}\right) = \frac{1}{2\sqrt{2}} \frac{\Gamma(\frac{1}{4})\Gamma(\frac{1}{2})}{\Gamma(\frac{1}{4}+\frac{1}{2})} \\ &= \frac{1}{2\sqrt{2}} \left(2^{\frac{1}{2}-1} \frac{\Gamma^2(\frac{1}{4})}{\Gamma(\frac{1}{2})}\right) \\ &= \frac{1}{4\sqrt{\pi}} \Gamma^2\left(\frac{1}{4}\right). \end{aligned}$$

□

14. 设 $\varphi(t)$ 是 $(0, +\infty)$ 上正严格递减的连续函数, 且 $\lim_{t \rightarrow 0^+} \varphi(t) = +\infty$, $\int_0^{+\infty} \varphi(t) dt = 1$. 设 $\psi(t)$ 是 $\varphi(t)$ 的反函数. 求证: 存在 $p \in (0, 1)$ 使得

$$\int_0^p \varphi(t) dt + \int_0^p \psi(t) dt = 1 + p^2$$

证明 分如下步骤: (1). 因为积分 $\int_0^{+\infty} \varphi(x) dx$ 收敛, $\varphi(x)$ 严格递减, 因此

$$\lim_{x \rightarrow +\infty} \varphi(x) = 0$$

否则, 必存在 $\alpha > 0$, 使得 $\varphi(x) \geq \alpha (0 < x < +\infty)$, 这样

$$\int_0^A \varphi(x) dx \geq \alpha A \rightarrow +\infty$$

推得级数发散, 因此矛盾.

(2). 因为 $\varphi(x)$ 连续, 严格递减, 所以

$$\lim_{x \rightarrow 0^+} (\varphi(x) - x) = +\infty, \quad \lim_{x \rightarrow +\infty} (\varphi(x) - x) = -\infty$$

因此在 $(0, +\infty)$ 上存在唯一的不动点 $\varphi(p) = p$. 且在 $0 < x < p$ 上有 $\varphi(x) > p$, 在 $x > p$ 上有 $\varphi(x) < p$. 改不动点也是反函数 $x = \psi(y)$ 的不动点 $p = \psi(p)$.

(3). 因为

$$1 > \int_0^p \varphi(x) dx > \int_0^p p dx = p^2$$

所以 $p \in (0, 1)$.

(4). 注意到 $y = \varphi(x)$ 和反函数 $x = \psi(y)$ 分别在 $0 < x < +\infty$ 和 $0 < y < +\infty$ 上的积分是同一条曲线在 Oxy 第一象限与 x 轴和 y 轴围成的面积, 因此

$$\int_0^{+\infty} \varphi(x) dx = 1, \quad \int_0^{+\infty} \psi(y) dy = 1$$

且 $\int_0^p \varphi(x)dx$ 是 y 轴、 x 轴上 $[0, p]$ 、直线 $x = p$ 以及函数 $y = \varphi(x)$ 围成的面积. 这块面积等于 $[0, p] \times [0, p]$ 的面积与 $\psi(y)$ 在 y 轴上 $[p, +\infty)$ 上覆盖的面积, 即

$$\int_0^p \varphi(x)dx = p^2 + \int_p^{+\infty} \psi(y)dy$$

由此推出

$$\int_0^p \varphi(x)dx + \int_0^p \psi(y)dy = 1 + p^2.$$

□

15. 设 $f(x)$ 是 $[0, +\infty)$ 上连续函数, 且 $\int_0^{+\infty} f^2(x)dx$ 收敛. 证明: 函数

$$g(x) = f(x) - 2e^{-x} \int_0^x e^t f(t)dt$$

满足

$$\int_0^{+\infty} g^2(x)dx = \int_0^{+\infty} f^2(x)dx$$

证明 令 $h(x) = \int_0^x e^t f(t)dt$ ($x \geq 0$), $h(0) = 0$ 则

$$\begin{aligned} g(x) - f(x) &= -2e^{-x}h(x), \\ g(x) + f(x) &= 2e^{-x}(h'(x) - h(x)), \\ \implies g^2(x) - f^2(x) &= -4e^{-2x}h(x)(h'(x) - h(x)) \\ &= -2(e^{-2x}h^2(x))' \\ \implies \int_0^X g^2(x)dx - \int_0^X f^2(x)dx &= -2e^{-2x}h^2(x)\Big|_0^X \end{aligned}$$

下面的问题是如何证明

$$\lim_{x \rightarrow +\infty} e^{-x}h(x) = \lim_{x \rightarrow +\infty} e^{-x} \int_0^x e^t f(t)dt = 0$$

因为 $\int_0^{+\infty} f^2(x)dx$ 收敛, 所以对任意的 $\varepsilon > 0$, 存在 $A > 0$, 使得当 $X > A$ 时, 有

$$\begin{aligned} \int_A^X f^2(x)dx &< \varepsilon^2, \\ \left(e^{-X} \int_A^X e^t f(t)dt \right)^2 &\leq e^{-2X} \int_A^X e^{2t} dt \int_A^X f^2(t)dt \\ &< \frac{1}{2} (1 - e^{-2(X-A)}) \varepsilon^2 < \varepsilon^2 \\ \implies \left| e^{-X} \int_A^X e^t f(t)dt \right| &< \varepsilon \end{aligned}$$

记 $M = \int_0^A e^t f(t)dt$, 则存在 $B > 0$ 使得当 $X > B$ 时有 $|e^{-X}M| < \varepsilon$, 因此当 $X > B$ 时有

$$\left| e^{-X} \int_0^X e^t f(t)dt \right| \leq \left| e^{-X} \int_0^A e^t f(t)dt \right| + \left| e^{-X} \int_A^X e^t f(t)dt \right| < 2\varepsilon$$
